invention, referred to here as Viral Genomic Address Messenger 1096 (VGAM1096) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15298] VGAM1096 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1096 was detected is described hereinabove with reference to Figs. 2–8.

[15299] VGAM1096 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Strawberry mottle virus. VGAM1096 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15300] VGAM1096 gene, herein designated VGAM GENE, encodes a VGAM1096 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1096 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1096 precursor RNA is designated SEQ ID:1082, and is provided hereinbelow with reference to the sequence listing part. Nu–

cleotide sequence SEQ ID:1082 is located at position 4444 relative to the genome of Strawberry mottle virus.

[15301] VGAM1096 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1096 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15302] An enzyme complex designated DICER COMPLEX, dices the VGAM1096 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1096 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1096 RNA is designated SEQ ID:3807, and is provided hereinbelow with reference to the sequence

listing part.

[15303] VGAM1096 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1096 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1096 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15304] VGAM1096 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1096 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1096 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1096 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1096 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15305] The complementary binding of VGAM1096 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1096 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1096 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1096 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15306] It is appreciated that VGAM1096 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1096 host target genes. The mRNA of each one of this plurality of VGAM1096 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1096 RNA, herein designated VGAM RNA, and which when bound by VGAM1096 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1096 host target proteins.

[15307] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1096 gene, herein designated VGAM GENE, on one or more VGAM1096 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15308] It is yet further appreciated that a function of VGAM1096 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1096 include diagnosis, prevention and treatment of viral infection by Strawberry mottle virus. Specific functions, and accordingly utilities, of VGAM1096 correlate with, and may be deduced from, the identity of the host target genes which VGAM1096 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15309] Nucleotide sequences of the VGAM1096 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1096 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1096 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1096 are further described hereinbelow with reference to Table 1.

[15310] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1096 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15311] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1097 (VGAM1097) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15312] VGAM1097 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1097 was detected is described hereinabove with reference to Figs. 2-8.

[15313] VGAM1097 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Strawberry mottle virus. VGAM1097 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15314] VGAM1097 gene, herein designated VGAM GENE, encodes a VGAM1097 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1097 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1097 precursor RNA is designated SEQ ID:1083, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1083 is located at position 5799 relative to the genome of Strawberry mottle virus.

[15315] VGAM1097 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1097 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15316] An enzyme complex designated DICER COMPLEX, dices the VGAM1097 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1097 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1097 RNA is designated SEQ ID:3808, and is provided hereinbelow with reference to the sequence listing part.

[15317] VGAM1097 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1097 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1097 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[15318] VGAM1097 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1097 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1097 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1097 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1097 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15319] The complementary binding of VGAM1097 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1097 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1097 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1097 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15320] It is appreciated that VGAM1097 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1097 host target genes. The mRNA of each one of this plurality of VGAM1097 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1097 RNA, herein designated VGAM RNA, and which when bound by VGAM1097 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1097 host target proteins.

[15321] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1097 gene, herein designated VGAM GENE, on one

or more VGAM1097 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15322] It is yet further appreciated that a function of VGAM1097 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1097 include diagnosis, prevention and treatment of viral infection by Strawberry mottle virus. Specific functions, and accordingly utilities, of VGAM1097 correlate with, and may be deduced from, the identity of the host target genes which VGAM1097 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15323] Nucleotide sequences of the VGAM1097 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1097 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1097 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1097 are further described hereinbelow with reference to Table 1.

[15324] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1097 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15325] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1098 (VGAM1098) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15326] VGAM1098 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1098 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[15327] VGAM1098 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Strawberry mottle virus. VGAM1098 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15328] VGAM1098 gene, herein designated VGAM GENE, encodes a VGAM1098 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1098 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1098 precursor RNA is designated SEQ ID:1084, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1084 is located at position 4573 relative to the genome of Strawberry mottle virus.

[15329] VGAM1098 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1098 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15330] An enzyme complex designated DICER COMPLEX, dices the VGAM1098 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1098 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide sequence of VGAM1098 RNA is designated SEQ ID:3809, and is provided hereinbelow with reference to the sequence listing part.

[15331] VGAM1098 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1098 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1098 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15332] VGAM1098 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1098 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1098 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1098 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1098 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[15333] The complementary binding of VGAM1098 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1098 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1098 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1098 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15334] It is appreciated that VGAM1098 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1098 host target genes. The mRNA of each one of this plurality of VGAM1098 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1098 RNA, herein designated VGAM RNA, and which when bound by VGAM1098 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1098 host target proteins.

[15335] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1098 gene, herein designated VGAM GENE, on one or more VGAM1098 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15336] It is yet further appreciated that a function of VGAM1098 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1098 include diagnosis, prevention and treatment of viral infection by Strawberry mottle virus. Specific functions, and accordingly utilities, of VGAM1098 correlate with, and may be deduced from, the identity of the host target genes which VGAM1098 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[15337] Nucleotide sequences of the VGAM1098 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1098 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1098 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1098 are further described hereinbelow with reference to Table 1.

[15338] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1098 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15339] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1099 (VGAM1099) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15340] VGAM1099 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1099 was detected is described hereinabove with reference to Figs. 2–8.

[15341] VGAM1099 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM1099 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15342] VGAM1099 gene, herein designated VGAM GENE, encodes a VGAM1099 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1099 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1099 precursor RNA is designated SEQ ID:1085, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1085 is located at position 122281 relative to the genome of African swine fever virus.

[15343] VGAM1099 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1099 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15344] An enzyme complex designated DICER COMPLEX, dices the VGAM1099 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1099 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1099 RNA is designated SEQ ID:3810, and is provided hereinbelow with reference to the sequence listing part.

[15345] VGAM1099 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1099 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1099 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15346] VGAM1099 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1099 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1099 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1099 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1099 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15347] The complementary binding of VGAM1099 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1099 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1099 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1099 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15348] It is appreciated that VGAM1099 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1099 host target genes. The mRNA of each one of this plurality of VGAM1099 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1099 RNA, herein designated VGAM RNA, and which when bound by VGAM1099 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1099 host target proteins.

[15349] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1099 gene, herein designated VGAM GENE, on one or more VGAM1099 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15350] It is yet further appreciated that a function of VGAM1099 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1099 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM1099 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1099 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15351] Nucleotide sequences of the VGAM1099 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1099 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1099 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1099 are further described hereinbelow with reference to Table 1.

[15352] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1099 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15353] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1100 (VGAM1100) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15354] VGAM1100 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1100 was detected is described hereinabove with reference to Figs. 2–8.

[15355] VGAM1100 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Strawberry mottle virus. VGAM1100 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15356] VGAM1100 gene, herein designated VGAM GENE, encodes a VGAM1100 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1100 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1100 precursor RNA is designated SEQ ID:1086, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1086 is located at position 5104 relative to the genome of Strawberry mottle virus.

[15357] VGAM1100 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1100 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15358] An enzyme complex designated DICER COMPLEX, dices the VGAM1100 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1100 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM1100 RNA is designated SEQ ID:3811, and is provided hereinbelow with reference to the sequence listing part.

[15359] VGAM1100 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1100 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1100 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15360] VGAM1100 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1100 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1100 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1100 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1100 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15361] The complementary binding of VGAM1100 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1100 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1100 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1100 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15362] It is appreciated that VGAM1100 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1100 host target genes. The mRNA of each one of this plurality of VGAM1100 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1100 RNA, herein designated VGAM RNA, and which when bound by VGAM1100 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1100 host target proteins.

[15363] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1100 gene, herein designated VGAM GENE, on one or more VGAM1100 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15364] It is yet further appreciated that a function of VGAM1100 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1100 include diagnosis, prevention and treatment of viral infection by Strawberry mottle virus. Specific functions, and accordingly utilities, of VGAM1100

correlate with, and may be deduced from, the identity of the host target genes which VGAM1100 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15365] Nucleotide sequences of the VGAM1100 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1100 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1100 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1100 are further described hereinbelow with reference to Table 1.

[15366] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1100 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15367] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1101 (VGAM1101) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[15368] VGAM1101 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1101 was detected is described hereinabove with reference to Figs. 2–8.

[15369] VGAM1101 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM1101 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15370] VGAM1101 gene, herein designated VGAM GENE, encodes a VGAM1101 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1101 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1101 precursor RNA is designated SEQ ID:1087, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1087 is located at position 126143 relative to the genome of African swine fever virus.

[15371] VGAM1101 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1101 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15372] An enzyme complex designated DICER COMPLEX, dices the VGAM1101 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1101 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM1101 RNA is designated SEQ ID:3812, and is provided hereinbelow with reference to the sequence listing part.

[15373] VGAM1101 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1101 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1101 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15374] VGAM1101 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1101 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1101 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1101 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1101 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15375] The complementary binding of VGAM1101 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1101 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1101 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1101 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15376] It is appreciated that VGAM1101 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1101 host target genes. The mRNA of each one of this plurality of VGAM1101 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1101 RNA, herein designated VGAM RNA, and which when bound by VGAM1101 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1101 host target proteins.

[15377] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1101 gene, herein designated VGAM GENE, on one or more VGAM1101 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15378] It is yet further appreciated that a function of VGAM1101 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1101 include diagnosis, prevention and

treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM1101 correlate with, and may be deduced from, the identity of the host target genes which VGAM1101 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15379] Nucleotide sequences of the VGAM1101 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1101 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1101 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1101 are further described hereinbelow with reference to Table 1.

[15380] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1101 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15381] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1102 (VGAM1102) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15382] VGAM1102 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1102 was detected is described hereinabove with reference to Figs. 2–8.

[15383] VGAM1102 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM1102 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15384] VGAM1102 gene, herein designated VGAM GENE, encodes a VGAM1102 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1102 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1102 precursor RNA is designated SEQ ID:1088, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1088 is located at position 123478 relative to the genome of African swine fever

virus.

[15385] VGAM1102 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1102 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15386] An enzyme complex designated DICER COMPLEX, dices the VGAM1102 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1102 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM1102 RNA is designated SEQ ID:3813, and is provided hereinbelow with reference to the sequence listing part.

[15387] VGAM1102 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1102 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1102 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15388] VGAM1102 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1102 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1102 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1102 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1102 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15389] The complementary binding of VGAM1102 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1102 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1102 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1102 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15390] It is appreciated that VGAM1102 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1102 host target genes. The mRNA of each one of this plurality of VGAM1102 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1102 RNA, herein designated VGAM RNA, and which when bound by VGAM1102 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1102 host target proteins.

[15391] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1102 gene, herein designated VGAM GENE, on one or more VGAM1102 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15392] It is yet further appreciated that a function of VGAM1102 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1102 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM1102 correlate with, and may be deduced from, the identity of the host target genes which VGAM1102 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15393] Nucleotide sequences of the VGAM1102 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1102 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1102 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1102 are further described hereinbelow with reference to Table 1.

[15394] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1102 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15395] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1103 (VGAM1103) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15396] VGAM1103 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1103 was detected is described hereinabove with reference to Figs. 2–8.

[15397] VGAM1103 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Strawberry mottle virus. VGAM1103 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15398] VGAM1103 gene, herein designated VGAM GENE, encodes a VGAM1103 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1103 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1103 precursor RNA is designated SEQ ID:1089, and is provided hereinbelow with reference to the sequence listing part. Nu–

cleotide sequence SEQ ID:1089 is located at position 1299 relative to the genome of Strawberry mottle virus.

[15399] VGAM1103 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1103 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15400] An enzyme complex designated DICER COMPLEX, dices the VGAM1103 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1103 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM1103 RNA is designated SEQ ID:3814, and is provided hereinbelow with reference to the sequence

listing part.

[15401] VGAM1103 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1103 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1103 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15402] VGAM1103 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1103 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1103 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1103 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15403] The complementary binding of VGAM1103 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1103 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1103 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1103 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15404] It is appreciated that VGAM1103 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1103 host target genes. The mRNA of each one of this plurality of VGAM1103 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1103 RNA, herein designated VGAM RNA, and which when bound by VGAM1103 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1103 host target proteins.

[15405] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1103 gene, herein designated VGAM GENE, on one or more VGAM1103 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15406] It is yet further appreciated that a function of VGAM1103

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of viral infection by Strawberry mottle virus. Specific functions, and accordingly utilities, of VGAM1103 correlate with, and may be deduced from, the identity of the host target genes which VGAM1103 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15407] Nucleotide sequences of the VGAM1103 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1103 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1103 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1103 are further described hereinbelow with reference to Table 1.

[15408] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1103 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15409] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1104 (VGAM1104) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15410] VGAM1104 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1104 was detected is described hereinabove with reference to Figs. 2–8.

[15411] VGAM1104 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 2. VGAM1104 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15412] VGAM1104 gene, herein designated VGAM GENE, encodes a VGAM1104 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1104 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1104 precursor RNA is designated SEQ ID:1090, and is provided here–

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1090 is located at position 94244 relative to the genome of Human herpesvirus 2.

[15413] VGAM1104 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1104 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15414] An enzyme complex designated DICER COMPLEX, dices the VGAM1104 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1104 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1104 RNA is designated SEQ ID:3815, and

is provided hereinbelow with reference to the sequence listing part.

[15415] VGAM1104 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1104 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1104 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15416] VGAM1104 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1104 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1104 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1104 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1104 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15417] The complementary binding of VGAM1104 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1104 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1104 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1104 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15418] It is appreciated that VGAM1104 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1104 host target genes. The mRNA of each one of this plurality of VGAM1104 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1104 RNA, herein designated VGAM RNA, and which when bound by VGAM1104 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1104 host target proteins.

[15419] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1104 gene, herein designated VGAM GENE, on one or more VGAM1104 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15420] It is yet further appreciated that a function of VGAM1104 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1104 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1104 correlate with, and may be deduced from, the identity of the host target genes which VGAM1104 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15421] Nucleotide sequences of the VGAM1104 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM1104 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1104 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1104 are further described hereinbelow with reference to Table 1.

[15422] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1104 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15423] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1105 (VGAM1105) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15424] VGAM1105 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1105 was detected is described hereinabove with reference to Figs. 2–8.

[15425] VGAM1105 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 2. VGAM1105 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15426] VGAM1105 gene, herein designated VGAM GENE, encodes a VGAM1105 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1105 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1105 precu-

sor RNA is designated SEQ ID:1091, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1091 is located at position 97913 relative to the genome of Human herpesvirus 2.

[15427] VGAM1105 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1105 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15428] An enzyme complex designated DICER COMPLEX, dices the VGAM1105 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1105 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide se-

quence of VGAM1105 RNA is designated SEQ ID:3816, and is provided hereinbelow with reference to the sequence listing part.

[15429] VGAM1105 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1105 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1105 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15430] VGAM1105 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1105 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1105 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1105 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1105 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15431] The complementary binding of VGAM1105 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1105 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1105 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1105 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15432] It is appreciated that VGAM1105 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1105 host target genes. The mRNA of

each one of this plurality of VGAM1105 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1105 RNA, herein designated VGAM RNA, and which when bound by VGAM1105 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1105 host target proteins.

[15433] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1105 gene, herein designated VGAM GENE, on one or more VGAM1105 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[15434] It is yet further appreciated that a function of VGAM1105 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1105 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1105 correlate with, and may be deduced from, the identity of the host target genes which VGAM1105 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15435] Nucleotide sequences of the VGAM1105 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1105 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1105 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1105 are further described hereinbelow with reference to Table 1.

[15436] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1105 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[15437] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1106 (VGAM1106) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15438] VGAM1106 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1106 was detected is described hereinabove with reference to Figs. 2–8.

[15439] VGAM1106 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 2. VGAM1106 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15440] VGAM1106 gene, herein designated VGAM GENE, encodes a VGAM1106 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1106 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1106 precursor RNA is designated SEQ ID:1092, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1092 is located at position 97030 relative to the genome of Human herpesvirus 2.

[15441] VGAM1106 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1106 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15442] An enzyme complex designated DICER COMPLEX, dices the VGAM1106 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1106 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1106 RNA is designated SEQ ID:3817, and is provided hereinbelow with reference to the sequence listing part.

[15443] VGAM1106 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1106 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1106 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15444] VGAM1106 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1106 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1106 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1106 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1106 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15445] The complementary binding of VGAM1106 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1106 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1106 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1106 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15446] It is appreciated that VGAM1106 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1106 host target genes. The mRNA of each one of this plurality of VGAM1106 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1106 RNA, herein designated VGAM RNA, and which when bound by VGAM1106 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1106 host target proteins.

[15447] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1106 gene, herein designated VGAM GENE, on one or more VGAM1106 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [15448] It is yet further appreciated that a function of VGAM1106 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1106 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1106 correlate with, and may be deduced from, the identity of the host target genes which VGAM1106 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [15449] Nucleotide sequences of the VGAM1106 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1106 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1106 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1106 are further described hereinbelow with reference to Table 1.
- [15450] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1106 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15451] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1107 (VGAM1107) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15452] VGAM1107 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1107 was detected is described hereinabove with reference to Figs. 2-8.

[15453] VGAM1107 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine adenovirus C. VGAM1107 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15454] VGAM1107 gene, herein designated VGAM GENE, encodes a VGAM1107 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1107 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1107 precursor RNA is designated SEQ ID:1093, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1093 is located at position 3553 relative to the genome of Porcine adenovirus C.

[15455] VGAM1107 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1107 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15456] An enzyme complex designated DICER COMPLEX, dices the VGAM1107 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1107 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1107 RNA is designated SEQ ID:3818, and is provided hereinbelow with reference to the sequence listing part.

[15457] VGAM1107 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1107 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1107 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15458] VGAM1107 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1107 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1107 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1107 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1107 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15459] The complementary binding of VGAM1107 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1107 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1107 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1107 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15460] It is appreciated that VGAM1107 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1107 host target genes. The mRNA of each one of this plurality of VGAM1107 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1107 RNA, herein designated VGAM RNA, and which when bound by VGAM1107 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1107 host target proteins.

[15461] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1107 gene, herein designated VGAM GENE, on one or more VGAM1107 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15462] It is yet further appreciated that a function of VGAM1107 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of viral infection by Porcine adenovirus C. Specific functions, and accordingly utilities, of VGAM1107 correlate with, and may be deduced from, the identity of the host target genes which VGAM1107 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15463] Nucleotide sequences of the VGAM1107 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1107 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1107 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1107 are further described hereinbelow with reference to Table 1.

[15464] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1107 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15465] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1108 (VGAM1108) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15466] VGAM1108 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1108 was detected is described hereinabove with reference to Figs. 2–8.

[15467] VGAM1108 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM1108 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15468] VGAM1108 gene, herein designated VGAM GENE, encodes a VGAM1108 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1108 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1108 precursor RNA is designated SEQ ID:1094, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1094 is located at position 30191 relative to the genome of Chimpanzee cytomegalovirus.

[15469] VGAM1108 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1108 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15470] An enzyme complex designated DICER COMPLEX, dices the VGAM1108 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1108 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM1108 RNA is designated SEQ ID:3819, and is provided hereinbelow with reference to the sequence listing part.

[15471] VGAM1108 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1108 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1108 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15472] VGAM1108 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1108 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1108 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1108 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1108 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15473] The complementary binding of VGAM1108 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1108 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1108 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1108 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[15474] It is appreciated that VGAM1108 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1108 host target genes. The mRNA of each one of this plurality of VGAM1108 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1108 RNA, herein designated VGAM RNA, and which when bound by VGAM1108 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1108 host target proteins.

[15475] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1108 gene, herein designated VGAM GENE, on one or more VGAM1108 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15476] It is yet further appreciated that a function of VGAM1108 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1108 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1108 correlate with, and may be deduced from, the identity of the host target genes which VGAM1108 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15477] Nucleotide sequences of the VGAM1108 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1108 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1108 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1108 are further described hereinbelow with reference to Table 1.

[15478] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1108 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15479] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1109 (VGAM1109) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15480] VGAM1109 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1109 was detected is described hereinabove with reference to Figs. 2-8.

[15481] VGAM1109 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM1109 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15482] VGAM1109 gene, herein designated VGAM GENE, encodes a VGAM1109 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1109 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1109 precursor RNA is designated SEQ ID:1095, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1095 is located at position 33182 relative to the genome of Chimpanzee cytomegalovirus.

[15483] VGAM1109 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1109 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15484] An enzyme complex designated DICER COMPLEX, dices the VGAM1109 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1109 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1109 RNA is designated SEQ ID:3820, and is provided hereinbelow with reference to the sequence listing part.

[15485] VGAM1109 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1109 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1109 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15486] VGAM1109 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1109 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1109 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1109 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1109 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15487] The complementary binding of VGAM1109 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1109 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1109 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1109 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15488] It is appreciated that VGAM1109 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1109 host target genes. The mRNA of each one of this plurality of VGAM1109 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1109 RNA, herein designated VGAM RNA, and which when bound by VGAM1109 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1109 host target proteins.

[15489] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1109 gene, herein designated VGAM GENE, on one or more VGAM1109 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15490] It is yet further appreciated that a function of VGAM1109 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1109 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1109 correlate with, and may be deduced from, the identity of the host target genes which VGAM1109 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15491] Nucleotide sequences of the VGAM1109 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1109 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1109 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1109 are further

described hereinbelow with reference to Table 1.

[15492] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1109 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15493] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1110 (VGAM1110) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15494] VGAM1110 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1110 was detected is described hereinabove with reference to Figs. 2-8.

[15495] VGAM1110 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Duck adenovirus 1. VGAM1110 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15496] VGAM1110 gene, herein designated VGAM GENE, encodes a VGAM1110 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1110 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1110 precursor RNA is designated SEQ ID:1096, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1096 is located at position 8004 relative to the genome of Duck adenovirus 1.

[15497] VGAM1110 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1110 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15498] An enzyme complex designated DICER COMPLEX, dices the VGAM1110 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1110 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1110 RNA is designated SEQ ID:3821, and is provided hereinbelow with reference to the sequence listing part.

[15499] VGAM1110 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1110 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1110 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15500] VGAM1110 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1110 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1110 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1110 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1110 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15501] The complementary binding of VGAM1110 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1110 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1110

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1110 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15502] It is appreciated that VGAM1110 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1110 host target genes. The mRNA of each one of this plurality of VGAM1110 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1110 RNA, herein designated VGAM RNA, and which when bound by VGAM1110 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1110 host target proteins.

[15503] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1110 gene, herein designated VGAM GENE, on one or more VGAM1110 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15504] It is yet further appreciated that a function of VGAM1110 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1110 include diagnosis, prevention and treatment of viral infection by Duck adenovirus 1. Specific functions, and accordingly utilities, of VGAM1110 correlate with, and may be deduced from, the identity of the host target genes which VGAM1110 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15505] Nucleotide sequences of the VGAM1110 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1110 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1110 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1110 are further described hereinbelow with reference to Table 1.

[15506] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1110 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15507] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1111 (VGAM1111) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15508] VGAM1111 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1111 was detected is described hereinabove with reference to Figs. 2-8.

[15509] VGAM1111 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM1111 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[15510] VGAM1111 gene, herein designated VGAM GENE, encodes a VGAM1111 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1111 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1111 precursor RNA is designated SEQ ID:1097, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1097 is located at position 103122 relative to the genome of Camelpox virus.

[15511] VGAM1111 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1111 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15512] An enzyme complex designated DICER COMPLEX, dices

the VGAM1111 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1111 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide sequence of VGAM1111 RNA is designated SEQ ID:3822, and is provided hereinbelow with reference to the sequence listing part.

[15513] VGAM1111 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1111 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1111 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15514] VGAM1111 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1111 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1111 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1111 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1111 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15515] The complementary binding of VGAM1111 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1111 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1111 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1111 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15516] It is appreciated that VGAM1111 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1111 host target genes. The mRNA of each one of this plurality of VGAM1111 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1111 RNA, herein designated VGAM RNA, and which when bound by VGAM1111 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1111 host target proteins.

[15517] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1111 gene, herein designated VGAM GENE, on one or more VGAM1111 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15518] It is yet further appreciated that a function of VGAM1111 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1111 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1111 correlate with, and may be deduced from, the identity of the host target genes which VGAM1111 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15519] Nucleotide sequences of the VGAM1111 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1111 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1111 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1111 are further described hereinbelow with reference to Table 1.

[15520] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1111 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15521] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1112 (VGAM1112) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15522] VGAM1112 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1112 was detected is described hereinabove with reference to Figs. 2-8.

[15523] VGAM1112 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM1112 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[15524] VGAM1112 gene, herein designated VGAM GENE, encodes a VGAM1112 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1112 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1112 precursor RNA is designated SEQ ID:1098, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1098 is located at position 103458 relative to the genome of Camelpox virus.

[15525] VGAM1112 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1112 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15526] An enzyme complex designated DICER COMPLEX, dices the VGAM1112 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1112 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1112 RNA is designated SEQ ID:3823, and is provided hereinbelow with reference to the sequence listing part.

[15527] VGAM1112 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1112 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1112 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15528] VGAM1112 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1112 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1112 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1112 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1112 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15529] The complementary binding of VGAM1112 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1112 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1112 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1112 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15530] It is appreciated that VGAM1112 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1112 host target genes. The mRNA of each one of this plurality of VGAM1112 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1112 RNA, herein designated VGAM RNA, and which when bound by VGAM1112 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1112 host target proteins.

[15531] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1112 gene, herein designated VGAM GENE, on one or more VGAM1112 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15532] It is yet further appreciated that a function of VGAM1112 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1112 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1112 correlate with, and may be deduced from, the identity of the host target genes which VGAM1112 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15533] Nucleotide sequences of the VGAM1112 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1112 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1112 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1112 are further described hereinbelow with reference to Table 1.

[15534] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1112 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15535] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1113 (VGAM1113) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15536] VGAM1113 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1113 was detected is described hereinabove with reference to Figs. 2-8.

[15537] VGAM1113 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus.

VGAM1113 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15538] VGAM1113 gene, herein designated VGAM GENE, encodes a VGAM1113 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1113 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1113 precursor RNA is designated SEQ ID:1099, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1099 is located at position 103649 relative to the genome of Camelpox virus.

[15539] VGAM1113 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1113 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[15540] An enzyme complex designated DICER COMPLEX, dices the VGAM1113 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1113 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1113 RNA is designated SEQ ID:3824, and is provided hereinbelow with reference to the sequence listing part.

[15541] VGAM1113 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1113 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1113 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15542] VGAM1113 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1113 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1113 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1113 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1113 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15543] The complementary binding of VGAM1113 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1113 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1113 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1113 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15544] It is appreciated that VGAM1113 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1113 host target genes. The mRNA of each one of this plurality of VGAM1113 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1113 RNA, herein designated VGAM RNA, and which when bound by VGAM1113 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1113 host target proteins.

[15545] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1113 gene, herein designated VGAM GENE, on one or more VGAM1113 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15546] It is yet further appreciated that a function of VGAM1113 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1113 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1113 correlate with, and may be deduced from, the identity of the host target genes which VGAM1113 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15547] Nucleotide sequences of the VGAM1113 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1113 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1113 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1113 are further described hereinbelow with reference to Table 1.

[15548] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1113 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15549] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1114 (VGAM1114) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15550] VGAM1114 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1114 was detected is described hereinabove with reference to Figs. 2-8.

[15551] VGAM1114 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Camelpox virus.

VGAM1114 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15552] VGAM1114 gene, herein designated VGAM GENE, encodes a VGAM1114 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1114 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1114 precursor RNA is designated SEQ ID:1100, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1100 is located at position 101465 relative to the genome of Camelpox virus.

[15553] VGAM1114 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1114 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15554] An enzyme complex designated DICER COMPLEX, dices the VGAM1114 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1114 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM1114 RNA is designated SEQ ID:3825, and is provided hereinbelow with reference to the sequence listing part.

[15555] VGAM1114 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1114 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1114 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15556] VGAM1114 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1114 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1114 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1114 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1114 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15557] The complementary binding of VGAM1114 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1114 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1114 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1114 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15558] It is appreciated that VGAM1114 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1114 host target genes. The mRNA of each one of this plurality of VGAM1114 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1114 RNA, herein designated VGAM RNA, and which when bound by VGAM1114 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1114 host target proteins.

[15559] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1114 gene, herein designated VGAM GENE, on one or more VGAM1114 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15560] It is yet further appreciated that a function of VGAM1114 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1114 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1114 correlate with, and may be deduced from, the identity of the host target genes which VGAM1114 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15561] Nucleotide sequences of the VGAM1114 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1114 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1114 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1114 are further described hereinbelow with reference to Table 1.

[15562] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1114 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15563] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1115 (VGAM1115) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15564] VGAM1115 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1115 was detected is described hereinabove with reference to Figs. 2-8.

[15565] VGAM1115 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus.

VGAM1115 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15566] VGAM1115 gene, herein designated VGAM GENE, encodes a VGAM1115 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1115 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1115 precursor RNA is designated SEQ ID:1101, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1101 is located at position 100938 relative to the genome of Camelpox virus.

[15567] VGAM1115 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1115 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15568] An enzyme complex designated DICER COMPLEX, dices the VGAM1115 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1115 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM1115 RNA is designated SEQ ID:3826, and is provided hereinbelow with reference to the sequence listing part.

[15569] VGAM1115 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1115 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1115 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[15570] VGAM1115 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1115 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1115 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1115 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1115 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15571] The complementary binding of VGAM1115 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1115 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1115 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1115 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15572] It is appreciated that VGAM1115 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1115 host target genes. The mRNA of each one of this plurality of VGAM1115 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1115 RNA, herein designated VGAM RNA, and which when bound by VGAM1115 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1115 host target proteins.

[15573] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1115 gene, herein designated VGAM GENE, on one

or more VGAM1115 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15574] It is yet further appreciated that a function of VGAM1115 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1115 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1115 correlate with, and may be deduced from, the identity of the host target genes which VGAM1115 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15575] Nucleotide sequences of the VGAM1115 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1115 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1115 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1115 are further described hereinbelow with reference to Table 1.

[15576] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1115 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15577] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1116 (VGAM1116) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15578] VGAM1116 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1116 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[15579] VGAM1116 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus.

VGAM1116 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15580] VGAM1116 gene, herein designated VGAM GENE, encodes a VGAM1116 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1116 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1116 precursor RNA is designated SEQ ID:1102, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1102 is located at position 49513 relative to the genome of Monkeypox virus.

[15581] VGAM1116 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1116 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15582] An enzyme complex designated DICER COMPLEX, dices the VGAM1116 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1116 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM1116 RNA is designated SEQ ID:3827, and is provided hereinbelow with reference to the sequence listing part.

[15583] VGAM1116 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1116 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1116 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15584] VGAM1116 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1116 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1116 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1116 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1116 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[15585] The complementary binding of VGAM1116 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1116 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1116 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1116 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15586] It is appreciated that VGAM1116 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1116 host target genes. The mRNA of each one of this plurality of VGAM1116 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1116 RNA, herein designated VGAM RNA, and which when bound by VGAM1116 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1116 host target proteins.

[15587] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1116 gene, herein designated VGAM GENE, on one or more VGAM1116 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15588] It is yet further appreciated that a function of VGAM1116 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1116 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM1116 correlate with, and may be deduced from, the identity of the host target genes which VGAM1116 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[15589] Nucleotide sequences of the VGAM1116 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1116 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1116 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1116 are further described hereinbelow with reference to Table 1.

[15590] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1116 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15591] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1117 (VGAM1117) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15592] VGAM1117 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1117 was detected is described hereinabove with reference to Figs. 2–8.

[15593] VGAM1117 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus.

VGAM1117 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15594] VGAM1117 gene, herein designated VGAM GENE, encodes a VGAM1117 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1117 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1117 precursor RNA is designated SEQ ID:1103, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1103 is located at position 45352 relative to the genome of Monkeypox virus.

[15595] VGAM1117 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1117 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15596] An enzyme complex designated DICER COMPLEX, dices the VGAM1117 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1117 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide sequence of VGAM1117 RNA is designated SEQ ID:3828, and is provided hereinbelow with reference to the sequence listing part.

[15597] VGAM1117 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1117 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1117 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15598] VGAM1117 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1117 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1117 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1117 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1117 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15599] The complementary binding of VGAM1117 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1117 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1117 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1117 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15600] It is appreciated that VGAM1117 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1117 host target genes. The mRNA of each one of this plurality of VGAM1117 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1117 RNA, herein designated VGAM RNA, and which when bound by VGAM1117 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1117 host target proteins.

[15601] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1117 gene, herein designated VGAM GENE, on one or more VGAM1117 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15602] It is yet further appreciated that a function of VGAM1117 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1117 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM1117 correlate with, and may be deduced from, the identity of the host target genes which VGAM1117 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[15603] Nucleotide sequences of the VGAM1117 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1117 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1117 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1117 are further described hereinbelow with reference to Table 1.

[15604] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1117 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15605] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1118 (VGAM1118) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15606] VGAM1118 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1118 was detected is described hereinabove with reference to Figs. 2–8.

[15607] VGAM1118 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus.

VGAM1118 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15608] VGAM1118 gene, herein designated VGAM GENE, encodes a VGAM1118 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1118 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1118 precursor RNA is designated SEQ ID:1104, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1104 is located at position 45554 relative to the genome of Monkeypox virus.

[15609] VGAM1118 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1118 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15610] An enzyme complex designated DICER COMPLEX, dices the VGAM1118 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1118 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1118 RNA is designated SEQ ID:3829, and is provided hereinbelow with reference to the sequence listing part.

[15611] VGAM1118 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1118 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1118 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15612] VGAM1118 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1118 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1118 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1118 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1118 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15613] The complementary binding of VGAM1118 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1118 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1118 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1118 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15614] It is appreciated that VGAM1118 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1118 host target genes. The mRNA of each one of this plurality of VGAM1118 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1118 RNA, herein designated VGAM RNA, and which when bound by VGAM1118 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1118 host target proteins.

[15615] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1118 gene, herein designated VGAM GENE, on one or more VGAM1118 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15616] It is yet further appreciated that a function of VGAM1118 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1118 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM1118 correlate with, and may be deduced from, the identity of the

host target genes which VGAM1118 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15617] Nucleotide sequences of the VGAM1118 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1118 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1118 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1118 are further described hereinbelow with reference to Table 1.

[15618] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1118 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15619] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1119 (VGAM1119) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15620] VGAM1119 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1119 was detected is described hereinabove with reference to Figs. 2–8.

[15621] VGAM1119 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM1119 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15622] VGAM1119 gene, herein designated VGAM GENE, encodes a VGAM1119 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1119 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1119 precursor RNA is designated SEQ ID:1105, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1105 is located at position 49470 relative to the genome of Camelpox virus.

[15623] VGAM1119 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1119 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15624] An enzyme complex designated DICER COMPLEX, dices the VGAM1119 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1119 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1119 RNA is designated SEQ ID:3830, and is provided hereinbelow with reference to the sequence listing part.

[15625] VGAM1119 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1119 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1119 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15626] VGAM1119 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1119 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1119 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1119 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1119 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15627] The complementary binding of VGAM1119 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1119 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1119 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1119 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15628] It is appreciated that VGAM1119 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1119 host target genes. The mRNA of each one of this plurality of VGAM1119 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1119 RNA, herein designated VGAM RNA, and which when bound by VGAM1119 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1119 host target proteins.

[15629] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1119 gene, herein designated VGAM GENE, on one or more VGAM1119 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15630] It is yet further appreciated that a function of VGAM1119 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1119 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1119 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM1119 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15631] Nucleotide sequences of the VGAM1119 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1119 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1119 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1119 are further described hereinbelow with reference to Table 1.

[15632] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1119 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15633] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1120 (VGAM1120) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[15634] VGAM1120 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1120 was detected is described hereinabove with reference to Figs. 2–8.

[15635] VGAM1120 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM1120 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15636] VGAM1120 gene, herein designated VGAM GENE, encodes a VGAM1120 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1120 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1120 precursor RNA is designated SEQ ID:1106, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1106 is located at position 44913 relative to the genome of Monkeypox virus.

[15637] VGAM1120 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1120 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15638] An enzyme complex designated DICER COMPLEX, dices the VGAM1120 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1120 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1120 RNA is designated SEQ ID:3831, and is provided hereinbelow with reference to the sequence listing part.

[15639] VGAM1120 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1120 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1120 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15640] VGAM1120 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1120 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1120 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1120 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1120 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15641] The complementary binding of VGAM1120 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1120 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1120 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1120 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15642] It is appreciated that VGAM1120 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1120 host target genes. The mRNA of each one of this plurality of VGAM1120 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1120 RNA, herein designated VGAM RNA, and which when bound by VGAM1120 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1120 host target proteins.

[15643] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1120 gene, herein designated VGAM GENE, on one or more VGAM1120 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15644] It is yet further appreciated that a function of VGAM1120 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1120 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific

functions, and accordingly utilities, of VGAM1120 correlate with, and may be deduced from, the identity of the host target genes which VGAM1120 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15645] Nucleotide sequences of the VGAM1120 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1120 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1120 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1120 are further described hereinbelow with reference to Table 1.

[15646] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1120 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15647] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1121 (VGAM1121) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[15648] VGAM1121 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1121 was detected is described hereinabove with reference to Figs. 2–8.

[15649] VGAM1121 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine herpesvirus 2. VGAM1121 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15650] VGAM1121 gene, herein designated VGAM GENE, encodes a VGAM1121 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1121 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1121 precursor RNA is designated SEQ ID:1107, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1107 is located at position 47689 relative to the genome of Saimiriine herpesvirus 2.

[15651] VGAM1121 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1121 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15652] An enzyme complex designated DICER COMPLEX, dices the VGAM1121 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1121 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1121 RNA is designated SEQ ID:3832, and is provided hereinbelow with reference to the sequence listing part.

[15653] VGAM1121 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1121 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1121 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15654] VGAM1121 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1121 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1121 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1121 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1121 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15655] The complementary binding of VGAM1121 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1121 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1121 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1121 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15656] It is appreciated that VGAM1121 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1121 host target genes. The mRNA of each one of this plurality of VGAM1121 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1121 RNA, herein designated VGAM RNA, and which when bound by VGAM1121 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1121 host target proteins.

[15657] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1121 gene, herein designated VGAM GENE, on one or more VGAM1121 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15658] It is yet further appreciated that a function of VGAM1121 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1121 include diagnosis, prevention and

treatment of viral infection by Saimiriine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1121 correlate with, and may be deduced from, the identity of the host target genes which VGAM1121 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15659] Nucleotide sequences of the VGAM1121 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1121 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1121 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1121 are further described hereinbelow with reference to Table 1.

[15660] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1121 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15661] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1122 (VGAM1122) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15662] VGAM1122 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1122 was detected is described hereinabove with reference to Figs. 2–8.

[15663] VGAM1122 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine herpesvirus 2. VGAM1122 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15664] VGAM1122 gene, herein designated VGAM GENE, encodes a VGAM1122 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1122 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1122 precursor RNA is designated SEQ ID:1108, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1108 is located at position 43628 relative to the genome of Saimiriine herpesvirus 2.

[15665] VGAM1122 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1122 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15666] An enzyme complex designated DICER COMPLEX, dices the VGAM1122 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1122 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1122 RNA is designated SEQ ID:3833, and is provided hereinbelow with reference to the sequence listing part.

[15667] VGAM1122 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1122 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1122 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15668] VGAM1122 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1122 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1122 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1122 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1122 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15669] The complementary binding of VGAM1122 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1122 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1122 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1122 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15670] It is appreciated that VGAM1122 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1122 host target genes. The mRNA of each one of this plurality of VGAM1122 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1122 RNA, herein designated VGAM

RNA, and which when bound by VGAM1122 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1122 host target proteins.

[15671] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1122 gene, herein designated VGAM GENE, on one or more VGAM1122 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15672] It is yet further appreciated that a function of VGAM1122 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1122 include diagnosis, prevention and treatment of viral infection by Saimiriine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1122 correlate with, and may be deduced from, the identity of the host target genes which VGAM1122 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15673] Nucleotide sequences of the VGAM1122 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1122 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1122 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1122 are further described hereinbelow with reference to Table 1.

[15674] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1122 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15675] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1123 (VGAM1123) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15676] VGAM1123 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1123 was detected is described hereinabove with reference to Figs. 2-8.

[15677] VGAM1123 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine herpesvirus 2. VGAM1123 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15678] VGAM1123 gene, herein designated VGAM GENE, encodes a VGAM1123 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1123 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1123 precursor RNA is designated SEQ ID:1109, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1109 is located at position

45011 relative to the genome of Saimiriine herpesvirus 2.

[15679] VGAM1123 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1123 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15680] An enzyme complex designated DICER COMPLEX, dices the VGAM1123 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1123 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1123 RNA is designated SEQ ID:3834, and is provided hereinbelow with reference to the sequence listing part.

[15681] VGAM1123 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1123 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1123 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15682] VGAM1123 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1123 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1123 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1123 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1123 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15683] The complementary binding of VGAM1123 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1123 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1123 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1123 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15684] It is appreciated that VGAM1123 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1123 host target genes. The mRNA of each one of this plurality of VGAM1123 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1123 RNA, herein designated VGAM RNA, and which when bound by VGAM1123 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1123 host target proteins.

[15685] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1123 gene, herein designated VGAM GENE, on one or more VGAM1123 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15686] It is yet further appreciated that a function of VGAM1123 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1123 include diagnosis, prevention and treatment of viral infection by Saimiriine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1123 correlate with, and may be deduced from, the identity of the host target genes which VGAM1123 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15687] Nucleotide sequences of the VGAM1123 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1123 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1123 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1123 are further described hereinbelow with reference to Table 1.

[15688] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1123 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15689] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1124 (VGAM1124) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15690] VGAM1124 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1124 was detected is described hereinabove with reference to Figs. 2–8.

[15691] VGAM1124 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine herpesvirus 2. VGAM1124 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15692] VGAM1124 gene, herein designated VGAM GENE, encodes a VGAM1124 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1124 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1124 precursor RNA is designated SEQ ID:1110, and is provided hereinbelow with reference to the sequence listing part. Nu–

cleotide sequence SEQ ID:1110 is located at position 43302 relative to the genome of Saimiriine herpesvirus 2.

[15693] VGAM1124 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1124 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15694] An enzyme complex designated DICER COMPLEX, dices the VGAM1124 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1124 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1124 RNA is designated SEQ ID:3835, and is provided hereinbelow with reference to the sequence

listing part.

[15695] VGAM1124 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1124 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1124 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15696] VGAM1124 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1124 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1124 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1124 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1124 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15697] The complementary binding of VGAM1124 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1124 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1124 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1124 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15698] It is appreciated that VGAM1124 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1124 host target genes. The mRNA of each one of this plurality of VGAM1124 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1124 RNA, herein designated VGAM RNA, and which when bound by VGAM1124 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1124 host target proteins.

[15699] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1124 gene, herein designated VGAM GENE, on one or more VGAM1124 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15700] It is yet further appreciated that a function of VGAM1124

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1124 include diagnosis, prevention and treatment of viral infection by Saimiriine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1124 correlate with, and may be deduced from, the identity of the host target genes which VGAM1124 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15701] Nucleotide sequences of the VGAM1124 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1124 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1124 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1124 are further described hereinbelow with reference to Table 1.

[15702] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1124 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15703] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1125 (VGAM1125) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15704] VGAM1125 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1125 was detected is described hereinabove with reference to Figs. 2–8.

[15705] VGAM1125 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine herpesvirus 2. VGAM1125 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15706] VGAM1125 gene, herein designated VGAM GENE, encodes a VGAM1125 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1125 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1125 precursor RNA is designated SEQ ID:1111, and is provided here–

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1111 is located at position 42164 relative to the genome of Saimiriine herpesvirus 2.

[15707] VGAM1125 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1125 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15708] An enzyme complex designated DICER COMPLEX, dices the VGAM1125 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1125 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM1125 RNA is designated SEQ ID:3836, and

is provided hereinbelow with reference to the sequence listing part.

[15709] VGAM1125 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1125 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1125 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15710] VGAM1125 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1125 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1125 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1125 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1125 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15711] The complementary binding of VGAM1125 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1125 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1125 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1125 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15712] It is appreciated that VGAM1125 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1125 host target genes. The mRNA of each one of this plurality of VGAM1125 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1125 RNA, herein designated VGAM RNA, and which when bound by VGAM1125 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1125 host target proteins.

[15713] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1125 gene, herein designated VGAM GENE, on one or more VGAM1125 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15714] It is yet further appreciated that a function of VGAM1125 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1125 include diagnosis, prevention and treatment of viral infection by Saimiriine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1125 correlate with, and may be deduced from, the identity of the host target genes which VGAM1125 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15715] Nucleotide sequences of the VGAM1125 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM1125 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1125 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1125 are further described hereinbelow with reference to Table 1.

[15716] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1125 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15717] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1126 (VGAM1126) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15718] VGAM1126 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1126 was detected is described hereinabove with reference to Figs. 2–8.

[15719] VGAM1126 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ononis yellow mosaic virus. VGAM1126 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15720] VGAM1126 gene, herein designated VGAM GENE, encodes a VGAM1126 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1126 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1126 precu-

sor RNA is designated SEQ ID:1112, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1112 is located at position 5517 relative to the genome of Ononis yellow mosaic virus.

[15721] VGAM1126 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1126 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15722] An enzyme complex designated DICER COMPLEX, dices the VGAM1126 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1126 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide se-

quence of VGAM1126 RNA is designated SEQ ID:3837, and is provided hereinbelow with reference to the sequence listing part.

[15723] VGAM1126 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1126 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1126 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15724] VGAM1126 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1126 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1126 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1126 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15725] The complementary binding of VGAM1126 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1126 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1126 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1126 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15726] It is appreciated that VGAM1126 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1126 host target genes. The mRNA of

each one of this plurality of VGAM1126 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1126 RNA, herein designated VGAM RNA, and which when bound by VGAM1126 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1126 host target proteins.

[15727] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1126 gene, herein designated VGAM GENE, on one or more VGAM1126 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[15728] It is yet further appreciated that a function of VGAM1126 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of viral infection by Ononis yellow mosaic virus. Specific functions, and accordingly utilities, of VGAM1126 correlate with, and may be deduced from, the identity of the host target genes which VGAM1126 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15729] Nucleotide sequences of the VGAM1126 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1126 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1126 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1126 are further described hereinbelow with reference to Table 1.

[15730] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1126 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[15731] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1127 (VGAM1127) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15732] VGAM1127 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1127 was detected is described hereinabove with reference to Figs. 2–8.

[15733] VGAM1127 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Barley stripe mosaic virus. VGAM1127 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15734] VGAM1127 gene, herein designated VGAM GENE, encodes a VGAM1127 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1127 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1127 precursor RNA is designated SEQ ID:1113, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1113 is located at position 1512 relative to the genome of Barley stripe mosaic virus.

[15735] VGAM1127 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1127 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15736] An enzyme complex designated DICER COMPLEX, dices the VGAM1127 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1127 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 59%) nucleotide sequence of VGAM1127 RNA is designated SEQ ID:3838, and is provided hereinbelow with reference to the sequence listing part.

[15737] VGAM1127 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1127 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1127 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15738] VGAM1127 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1127 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1127 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1127 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1127 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15739] The complementary binding of VGAM1127 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1127 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1127 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1127 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15740] It is appreciated that VGAM1127 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1127 host target genes. The mRNA of each one of this plurality of VGAM1127 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1127 RNA, herein designated VGAM RNA, and which when bound by VGAM1127 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1127 host target proteins.

[15741] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1127 gene, herein designated VGAM GENE, on one or more VGAM1127 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [15742] It is yet further appreciated that a function of VGAM1127 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1127 include diagnosis, prevention and treatment of viral infection by Barley stripe mosaic virus. Specific functions, and accordingly utilities, of VGAM1127 correlate with, and may be deduced from, the identity of the host target genes which VGAM1127 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [15743] Nucleotide sequences of the VGAM1127 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1127 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1127 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1127 are further described hereinbelow with reference to Table 1.
- [15744] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1127 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15745] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1128 (VGAM1128) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15746] VGAM1128 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1128 was detected is described hereinabove with reference to Figs. 2-8.

[15747] VGAM1128 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Barley stripe mosaic virus. VGAM1128 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15748] VGAM1128 gene, herein designated VGAM GENE, encodes a VGAM1128 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1128 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1128 precursor RNA is designated SEQ ID:1114, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1114 is located at position 2166 relative to the genome of Barley stripe mosaic virus.

[15749] VGAM1128 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1128 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15750] An enzyme complex designated DICER COMPLEX, dices the VGAM1128 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1128 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM1128 RNA is designated SEQ ID:3839, and is provided hereinbelow with reference to the sequence listing part.

[15751] VGAM1128 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1128 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1128 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15752] VGAM1128 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1128 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1128 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1128 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1128 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15753] The complementary binding of VGAM1128 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1128 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1128 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1128 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15754] It is appreciated that VGAM1128 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1128 host target genes. The mRNA of each one of this plurality of VGAM1128 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1128 RNA, herein designated VGAM RNA, and which when bound by VGAM1128 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1128 host target proteins.

[15755] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1128 gene, herein designated VGAM GENE, on one or more VGAM1128 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15756] It is yet further appreciated that a function of VGAM1128 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1128 include diagnosis, prevention and treatment of viral infection by Barley stripe mosaic virus. Specific functions, and accordingly utilities, of VGAM1128 correlate with, and may be deduced from, the identity of the host target genes which VGAM1128 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15757] Nucleotide sequences of the VGAM1128 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1128 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1128 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1128 are further described hereinbelow with reference to Table 1.

[15758] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1128 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15759] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1129 (VGAM1129) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15760] VGAM1129 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1129 was detected is described hereinabove with reference to Figs. 2–8.

[15761] VGAM1129 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Barley stripe mosaic virus. VGAM1129 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15762] VGAM1129 gene, herein designated VGAM GENE, encodes a VGAM1129 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1129 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1129 precursor RNA is designated SEQ ID:1115, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1115 is located at position 2771 relative to the genome of Barley stripe mosaic virus.

[15763] VGAM1129 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1129 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15764] An enzyme complex designated DICER COMPLEX, dices the VGAM1129 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1129 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1129 RNA is designated SEQ ID:3840, and is provided hereinbelow with reference to the sequence listing part.

[15765] VGAM1129 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1129 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1129 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15766] VGAM1129 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1129 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1129 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1129 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1129 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15767] The complementary binding of VGAM1129 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1129 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1129 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1129 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15768] It is appreciated that VGAM1129 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1129 host target genes. The mRNA of each one of this plurality of VGAM1129 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1129 RNA, herein designated VGAM RNA, and which when bound by VGAM1129 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1129 host target proteins.

[15769] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1129 gene, herein designated VGAM GENE, on one or more VGAM1129 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15770] It is yet further appreciated that a function of VGAM1129 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1129 include diagnosis, prevention and treatment of viral infection by Barley stripe mosaic virus. Specific functions, and accordingly utilities, of VGAM1129 correlate with, and may be deduced from, the identity of the host target genes which VGAM1129 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15771] Nucleotide sequences of the VGAM1129 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1129 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1129 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1129 are further described hereinbelow with reference to Table 1.

[15772] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1129 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15773] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1130 (VGAM1130) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15774] VGAM1130 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1130 was detected is described hereinabove with reference to Figs. 2-8.

[15775] VGAM1130 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Barley stripe mosaic virus. VGAM1130 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15776] VGAM1130 gene, herein designated VGAM GENE, encodes a VGAM1130 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1130 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1130 precursor RNA is designated SEQ ID:1116, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1116 is located at position 3018 relative to the genome of Barley stripe mosaic virus.

[15777] VGAM1130 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1130 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15778] An enzyme complex designated DICER COMPLEX, dices the VGAM1130 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1130 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1130 RNA is designated SEQ ID:3841, and is provided hereinbelow with reference to the sequence listing part.

[15779] VGAM1130 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1130 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1130 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15780] VGAM1130 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1130 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1130 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1130 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1130 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15781] The complementary binding of VGAM1130 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1130 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1130 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1130 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[15782] It is appreciated that VGAM1130 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1130 host target genes. The mRNA of each one of this plurality of VGAM1130 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1130 RNA, herein designated VGAM RNA, and which when bound by VGAM1130 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1130 host target proteins.

[15783] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1130 gene, herein designated VGAM GENE, on one or more VGAM1130 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15784] It is yet further appreciated that a function of VGAM1130 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1130 include diagnosis, prevention and treatment of viral infection by Barley stripe mosaic virus. Specific functions, and accordingly utilities, of VGAM1130 correlate with, and may be deduced from, the identity of the host target genes which VGAM1130 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15785] Nucleotide sequences of the VGAM1130 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1130 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1130 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1130 are further described hereinbelow with reference to Table 1.

[15786] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1130 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15787] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1131 (VGAM1131) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15788] VGAM1131 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1131 was detected is described hereinabove with reference to Figs. 2-8.

[15789] VGAM1131 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Barley stripe mosaic virus. VGAM1131 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15790] VGAM1131 gene, herein designated VGAM GENE, encodes a VGAM1131 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1131 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1131 precursor RNA is designated SEQ ID:1117, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1117 is located at position 1786 relative to the genome of Barley stripe mosaic virus.

[15791] VGAM1131 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1131 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15792] An enzyme complex designated DICER COMPLEX, dices the VGAM1131 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1131 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1131 RNA is designated SEQ ID:3842, and is provided hereinbelow with reference to the sequence listing part.

[15793] VGAM1131 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1131 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1131 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15794] VGAM1131 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1131 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1131 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1131 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1131 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15795] The complementary binding of VGAM1131 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1131 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1131 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1131 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15796] It is appreciated that VGAM1131 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1131 host target genes. The mRNA of each one of this plurality of VGAM1131 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1131 RNA, herein designated VGAM RNA, and which when bound by VGAM1131 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1131 host target proteins.

[15797] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1131 gene, herein designated VGAM GENE, on one or more VGAM1131 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15798] It is yet further appreciated that a function of VGAM1131 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1131 include diagnosis, prevention and treatment of viral infection by Barley stripe mosaic virus. Specific functions, and accordingly utilities, of VGAM1131 correlate with, and may be deduced from, the identity of the host target genes which VGAM1131 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15799] Nucleotide sequences of the VGAM1131 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1131 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1131 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1131 are further described hereinbelow with reference to Table 1.

[15800] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1131 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15801] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1132 (VGAM1132) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15802] VGAM1132 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1132 was detected is described hereinabove with reference to Figs. 2-8.

[15803] VGAM1132 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Barley stripe mosaic virus. VGAM1132 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15804] VGAM1132 gene, herein designated VGAM GENE, encodes

a VGAM1132 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1132 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1132 precursor RNA is designated SEQ ID:1118, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1118 is located at position 849 relative to the genome of Barley stripe mosaic virus.

[15805] VGAM1132 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1132 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15806] An enzyme complex designated DICER COMPLEX, dices the VGAM1132 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1132 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1132 RNA is designated SEQ ID:3843, and is provided hereinbelow with reference to the sequence listing part.

[15807] VGAM1132 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1132 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1132 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15808] VGAM1132 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1132 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1132 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1132 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1132 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15809] The complementary binding of VGAM1132 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1132 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1132 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1132 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15810] It is appreciated that VGAM1132 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1132 host target genes. The mRNA of each one of this plurality of VGAM1132 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1132 RNA, herein designated VGAM RNA, and which when bound by VGAM1132 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1132 host target proteins.

[15811] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1132 gene, herein designated VGAM GENE, on one or more VGAM1132 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15812] It is yet further appreciated that a function of VGAM1132 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1132 include diagnosis, prevention and treatment of viral infection by Barley stripe mosaic virus. Specific functions, and accordingly utilities, of VGAM1132 correlate with, and may be deduced from, the identity of the host target genes which VGAM1132 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15813] Nucleotide sequences of the VGAM1132 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1132 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1132 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1132 are further

described hereinbelow with reference to Table 1.

[15814] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1132 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15815] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1133 (VGAM1133) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15816] VGAM1133 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1133 was detected is described hereinabove with reference to Figs. 2-8.

[15817] VGAM1133 gene, herein designated VGAM GENE, is a viral gene contained in the genome of maize rayado fino virus. VGAM1133 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15818] VGAM1133 gene, herein designated VGAM GENE, encodes a VGAM1133 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1133 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1133 precursor RNA is designated SEQ ID:1119, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1119 is located at position 5936 relative to the genome of maize rayado fino virus.

[15819] VGAM1133 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1133 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15820] An enzyme complex designated DICER COMPLEX, dices the VGAM1133 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1133 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1133 RNA is designated SEQ ID:3844, and is provided hereinbelow with reference to the sequence listing part.

[15821] VGAM1133 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1133 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1133 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15822] VGAM1133 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1133 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1133 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1133 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1133 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15823] The complementary binding of VGAM1133 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1133 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1133

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1133 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15824] It is appreciated that VGAM1133 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1133 host target genes. The mRNA of each one of this plurality of VGAM1133 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1133 RNA, herein designated VGAM RNA, and which when bound by VGAM1133 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1133 host target proteins.

[15825] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1133 gene, herein designated VGAM GENE, on one or more VGAM1133 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15826] It is yet further appreciated that a function of VGAM1133 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1133 include diagnosis, prevention and treatment of viral infection by maize rayado fino virus. Specific functions, and accordingly utilities, of VGAM1133 correlate with, and may be deduced from, the identity of the host target genes which VGAM1133 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15827] Nucleotide sequences of the VGAM1133 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1133 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1133 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1133 are further described hereinbelow with reference to Table 1.

[15828] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1133 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15829] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1134 (VGAM1134) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15830] VGAM1134 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1134 was detected is described hereinabove with reference to Figs. 2-8.

[15831] VGAM1134 gene, herein designated VGAM GENE, is a viral gene contained in the genome of maize rayado fino virus. VGAM1134 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[15832] VGAM1134 gene, herein designated VGAM GENE, encodes a VGAM1134 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1134 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1134 precursor RNA is designated SEQ ID:1120, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1120 is located at position 4286 relative to the genome of maize rayado fino virus.

[15833] VGAM1134 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1134 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15834] An enzyme complex designated DICER COMPLEX, dices

the VGAM1134 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1134 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1134 RNA is designated SEQ ID:3845, and is provided hereinbelow with reference to the sequence listing part.

[15835] VGAM1134 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1134 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1134 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15836] VGAM1134 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1134 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1134 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1134 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1134 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15837] The complementary binding of VGAM1134 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1134 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1134 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1134 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15838] It is appreciated that VGAM1134 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1134 host target genes. The mRNA of each one of this plurality of VGAM1134 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1134 RNA, herein designated VGAM RNA, and which when bound by VGAM1134 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1134 host target proteins.

[15839] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1134 gene, herein designated VGAM GENE, on one or more VGAM1134 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15840] It is yet further appreciated that a function of VGAM1134 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1134 include diagnosis, prevention and treatment of viral infection by maize rayado fino virus. Specific functions, and accordingly utilities, of VGAM1134 correlate with, and may be deduced from, the identity of the host target genes which VGAM1134 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15841] Nucleotide sequences of the VGAM1134 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1134 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1134 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1134 are further described hereinbelow with reference to Table 1.

[15842] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1134 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15843] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1135 (VGAM1135) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15844] VGAM1135 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1135 was detected is described hereinabove with reference to Figs. 2-8.

[15845] VGAM1135 gene, herein designated VGAM GENE, is a viral gene contained in the genome of maize rayado fino virus. VGAM1135 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[15846] VGAM1135 gene, herein designated VGAM GENE, encodes a VGAM1135 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1135 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1135 precursor RNA is designated SEQ ID:1121, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1121 is located at position 1316 relative to the genome of maize rayado fino virus.

[15847] VGAM1135 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1135 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15848] An enzyme complex designated DICER COMPLEX, dices the VGAM1135 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1135 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM1135 RNA is designated SEQ ID:3846, and is provided hereinbelow with reference to the sequence listing part.

[15849] VGAM1135 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1135 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1135 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15850] VGAM1135 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1135 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1135 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1135 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15851] The complementary binding of VGAM1135 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1135 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1135 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1135 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15852] It is appreciated that VGAM1135 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1135 host target genes. The mRNA of each one of this plurality of VGAM1135 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1135 RNA, herein designated VGAM RNA, and which when bound by VGAM1135 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1135 host target proteins.

[15853] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1135 gene, herein designated VGAM GENE, on one or more VGAM1135 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15854] It is yet further appreciated that a function of VGAM1135 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of viral infection by maize rayado fino virus. Specific functions, and accordingly utilities, of VGAM1135 correlate with, and may be deduced from, the identity of the host target genes which VGAM1135 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15855] Nucleotide sequences of the VGAM1135 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1135 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1135 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1135 are further described hereinbelow with reference to Table 1.

[15856] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1135 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15857] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1136 (VGAM1136) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15858] VGAM1136 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1136 was detected is described hereinabove with reference to Figs. 2-8.

[15859] VGAM1136 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet mild yellowing

virus. VGAM1136 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15860] VGAM1136 gene, herein designated VGAM GENE, encodes a VGAM1136 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1136 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1136 precursor RNA is designated SEQ ID:1122, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1122 is located at position 1677 relative to the genome of Beet mild yellowing virus.

[15861] VGAM1136 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1136 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[15862] An enzyme complex designated DICER COMPLEX, dices the VGAM1136 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1136 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1136 RNA is designated SEQ ID:3847, and is provided hereinbelow with reference to the sequence listing part.

[15863] VGAM1136 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1136 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1136 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15864] VGAM1136 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1136 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1136 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1136 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1136 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15865] The complementary binding of VGAM1136 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1136 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1136 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1136 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15866] It is appreciated that VGAM1136 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1136 host target genes. The mRNA of each one of this plurality of VGAM1136 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1136 RNA, herein designated VGAM RNA, and which when bound by VGAM1136 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1136 host target proteins.

[15867] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1136 gene, herein designated VGAM GENE, on one or more VGAM1136 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15868] It is yet further appreciated that a function of VGAM1136 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1136 include diagnosis, prevention and treatment of viral infection by Beet mild yellowing virus. Specific functions, and accordingly utilities, of VGAM1136 correlate with, and may be deduced from, the identity of the host target genes which VGAM1136 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15869] Nucleotide sequences of the VGAM1136 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1136 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1136 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1136 are further described hereinbelow with reference to Table 1.

[15870] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1136 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15871] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1137 (VGAM1137) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15872] VGAM1137 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1137 was detected is described hereinabove with reference to Figs. 2-8.

[15873] VGAM1137 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Beet mild yellowing virus. VGAM1137 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15874] VGAM1137 gene, herein designated VGAM GENE, encodes a VGAM1137 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1137 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1137 precursor RNA is designated SEQ ID:1123, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1123 is located at position 3269 relative to the genome of Beet mild yellowing virus.

[15875] VGAM1137 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1137 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15876] An enzyme complex designated DICER COMPLEX, dices the VGAM1137 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1137 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of VGAM1137 RNA is designated SEQ ID:3848, and is provided hereinbelow with reference to the sequence listing part.

[15877] VGAM1137 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1137 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1137 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15878] VGAM1137 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1137 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1137 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1137 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1137 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15879] The complementary binding of VGAM1137 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1137 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1137 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1137 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15880] It is appreciated that VGAM1137 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1137 host target genes. The mRNA of each one of this plurality of VGAM1137 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1137 RNA, herein designated VGAM RNA, and which when bound by VGAM1137 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1137 host target proteins.

[15881] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1137 gene, herein designated VGAM GENE, on one or more VGAM1137 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15882] It is yet further appreciated that a function of VGAM1137 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1137 include diagnosis, prevention and treatment of viral infection by Beet mild yellowing virus. Specific functions, and accordingly utilities, of VGAM1137 correlate with, and may be deduced from, the identity of the host target genes which VGAM1137 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15883] Nucleotide sequences of the VGAM1137 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1137 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1137 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1137 are further described hereinbelow with reference to Table 1.

[15884] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1137 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15885] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1138 (VGAM1138) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15886] VGAM1138 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1138 was detected is described hereinabove with reference to Figs. 2-8.

[15887] VGAM1138 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet mild yellowing virus. VGAM1138 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15888] VGAM1138 gene, herein designated VGAM GENE, encodes a VGAM1138 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1138 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1138 precursor RNA is designated SEQ ID:1124, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1124 is located at position 1988 relative to the genome of Beet mild yellowing virus.

[15889] VGAM1138 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1138 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15890] An enzyme complex designated DICER COMPLEX, dices the VGAM1138 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1138 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM1138 RNA is designated SEQ ID:3849, and is provided hereinbelow with reference to the sequence listing part.

[15891] VGAM1138 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1138 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1138 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[15892] VGAM1138 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1138 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1138 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1138 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1138 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15893] The complementary binding of VGAM1138 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1138 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1138 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1138 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15894] It is appreciated that VGAM1138 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1138 host target genes. The mRNA of each one of this plurality of VGAM1138 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1138 RNA, herein designated VGAM RNA, and which when bound by VGAM1138 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1138 host target proteins.

[15895] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1138 gene, herein designated VGAM GENE, on one

or more VGAM1138 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15896] It is yet further appreciated that a function of VGAM1138 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1138 include diagnosis, prevention and treatment of viral infection by Beet mild yellowing virus. Specific functions, and accordingly utilities, of VGAM1138 correlate with, and may be deduced from, the identity of the host target genes which VGAM1138 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15897] Nucleotide sequences of the VGAM1138 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1138 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1138 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1138 are further described hereinbelow with reference to Table 1.

[15898] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1138 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15899] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1139 (VGAM1139) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15900] VGAM1139 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1139 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[15901] VGAM1139 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chayote mosaic tymovirus. VGAM1139 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15902] VGAM1139 gene, herein designated VGAM GENE, encodes a VGAM1139 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1139 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1139 precursor RNA is designated SEQ ID:1125, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1125 is located at position 4987 relative to the genome of Chayote mosaic tymovirus.

[15903] VGAM1139 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1139 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15904] An enzyme complex designated DICER COMPLEX, dices the VGAM1139 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1139 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of VGAM1139 RNA is designated SEQ ID:3850, and is provided hereinbelow with reference to the sequence listing part.

[15905] VGAM1139 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1139 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1139 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15906] VGAM1139 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1139 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1139 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1139 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1139 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[15907] The complementary binding of VGAM1139 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1139 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1139 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1139 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15908] It is appreciated that VGAM1139 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1139 host target genes. The mRNA of each one of this plurality of VGAM1139 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1139 RNA, herein designated VGAM RNA, and which when bound by VGAM1139 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1139 host target proteins.

[15909] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1139 gene, herein designated VGAM GENE, on one or more VGAM1139 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15910] It is yet further appreciated that a function of VGAM1139 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1139 include diagnosis, prevention and treatment of viral infection by Chayote mosaic tymovirus. Specific functions, and accordingly utilities, of VGAM1139 correlate with, and may be deduced from, the identity of the host target genes which VGAM1139 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[15911] Nucleotide sequences of the VGAM1139 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1139 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1139 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1139 are further described hereinbelow with reference to Table 1.

[15912] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1139 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15913] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1140 (VGAM1140) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15914] VGAM1140 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1140 was detected is described hereinabove with reference to Figs. 2–8.

[15915] VGAM1140 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chayote mosaic tymovirus. VGAM1140 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15916] VGAM1140 gene, herein designated VGAM GENE, encodes a VGAM1140 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1140 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1140 precursor RNA is designated SEQ ID:1126, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1126 is located at position 709 relative to the genome of Chayote mosaic tymovirus.

[15917] VGAM1140 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1140 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15918] An enzyme complex designated DICER COMPLEX, dices the VGAM1140 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1140 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1140 RNA is designated SEQ ID:3851, and is provided hereinbelow with reference to the sequence listing part.

[15919] VGAM1140 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1140 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1140 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15920] VGAM1140 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1140 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1140 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1140 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1140 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15921] The complementary binding of VGAM1140 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1140 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1140 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1140 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15922] It is appreciated that VGAM1140 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1140 host target genes. The mRNA of each one of this plurality of VGAM1140 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1140 RNA, herein designated VGAM RNA, and which when bound by VGAM1140 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1140 host target proteins.

[15923] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1140 gene, herein designated VGAM GENE, on one or more VGAM1140 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15924] It is yet further appreciated that a function of VGAM1140 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1140 include diagnosis, prevention and treatment of viral infection by Chayote mosaic tymovirus. Specific functions, and accordingly utilities, of VGAM1140 correlate with, and may be deduced from, the identity of the host target genes which VGAM1140 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[15925] Nucleotide sequences of the VGAM1140 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1140 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1140 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1140 are further described hereinbelow with reference to Table 1.

[15926] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1140 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15927] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1141 (VGAM1141) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15928] VGAM1141 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1141 was detected is described hereinabove with reference to Figs. 2–8.

[15929] VGAM1141 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chayote mosaic tymovirus. VGAM1141 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15930] VGAM1141 gene, herein designated VGAM GENE, encodes a VGAM1141 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1141 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1141 precursor RNA is designated SEQ ID:1127, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1127 is located at position 1116 relative to the genome of Chayote mosaic tymovirus.

[15931] VGAM1141 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1141 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15932] An enzyme complex designated DICER COMPLEX, dices the VGAM1141 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1141 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1141 RNA is designated SEQ ID:3852, and is provided hereinbelow with reference to the sequence listing part.

[15933] VGAM1141 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1141 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1141 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15934] VGAM1141 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1141 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1141 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1141 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1141 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15935] The complementary binding of VGAM1141 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1141 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1141 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1141 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15936] It is appreciated that VGAM1141 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1141 host target genes. The mRNA of each one of this plurality of VGAM1141 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1141 RNA, herein designated VGAM RNA, and which when bound by VGAM1141 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1141 host target proteins.

[15937] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1141 gene, herein designated VGAM GENE, on one or more VGAM1141 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15938] It is yet further appreciated that a function of VGAM1141 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1141 include diagnosis, prevention and treatment of viral infection by Chayote mosaic tymovirus. Specific functions, and accordingly utilities, of VGAM1141 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1141 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15939] Nucleotide sequences of the VGAM1141 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1141 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1141 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1141 are further described hereinbelow with reference to Table 1.

[15940] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1141 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15941] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1142 (VGAM1142) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15942] VGAM1142 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1142 was detected is described hereinabove with reference to Figs. 2–8.

[15943] VGAM1142 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bamboo mosaic virus. VGAM1142 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15944] VGAM1142 gene, herein designated VGAM GENE, encodes a VGAM1142 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1142 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1142 precursor RNA is designated SEQ ID:1128, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1128 is located at position 5891 relative to the genome of Bamboo mosaic virus.

[15945] VGAM1142 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1142 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15946] An enzyme complex designated DICER COMPLEX, dices the VGAM1142 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1142 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1142 RNA is designated SEQ ID:3853, and is provided hereinbelow with reference to the sequence listing part.

[15947] VGAM1142 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1142 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1142 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15948] VGAM1142 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1142 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1142 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1142 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1142 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15949] The complementary binding of VGAM1142 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1142 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1142 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1142 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15950] It is appreciated that VGAM1142 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1142 host target genes. The mRNA of each one of this plurality of VGAM1142 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1142 RNA, herein designated VGAM RNA, and which when bound by VGAM1142 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1142 host target proteins.

[15951] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1142 gene, herein designated VGAM GENE, on one or more VGAM1142 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15952] It is yet further appreciated that a function of VGAM1142 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1142 include diagnosis, prevention and treatment of viral infection by Bamboo mosaic virus. Specific functions, and accordingly utilities, of VGAM1142

correlate with, and may be deduced from, the identity of the host target genes which VGAM1142 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15953] Nucleotide sequences of the VGAM1142 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1142 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1142 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1142 are further described hereinbelow with reference to Table 1.

[15954] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1142 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15955] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1143 (VGAM1143) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

- [15956] VGAM1143 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1143 was detected is described hereinabove with reference to Figs. 2–8.
- [15957] VGAM1143 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bamboo mosaic virus. VGAM1143 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.
- [15958] VGAM1143 gene, herein designated VGAM GENE, encodes a VGAM1143 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1143 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1143 precursor RNA is designated SEQ ID:1129, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1129 is located at position 1369 relative to the genome of Bamboo mosaic virus.
- [15959] VGAM1143 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1143 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15960] An enzyme complex designated DICER COMPLEX, dices the VGAM1143 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1143 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1143 RNA is designated SEQ ID:3854, and is provided hereinbelow with reference to the sequence listing part.

[15961] VGAM1143 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1143 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1143 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15962] VGAM1143 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1143 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1143 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1143 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1143 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15963] The complementary binding of VGAM1143 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1143 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1143 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1143 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15964] It is appreciated that VGAM1143 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1143 host target genes. The mRNA of each one of this plurality of VGAM1143 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1143 RNA, herein designated VGAM RNA, and which when bound by VGAM1143 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1143 host target proteins.

[15965] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1143 gene, herein designated VGAM GENE, on one or more VGAM1143 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15966] It is yet further appreciated that a function of VGAM1143 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1143 include diagnosis, prevention and treatment of viral infection by Bamboo mosaic virus. Spe-

cific functions, and accordingly utilities, of VGAM1143 correlate with, and may be deduced from, the identity of the host target genes which VGAM1143 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15967] Nucleotide sequences of the VGAM1143 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1143 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1143 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1143 are further described hereinbelow with reference to Table 1.

[15968] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1143 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15969] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1144 (VGAM1144) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[15970] VGAM1144 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1144 was detected is described hereinabove with reference to Figs. 2–8.

[15971] VGAM1144 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bamboo mosaic virus. VGAM1144 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15972] VGAM1144 gene, herein designated VGAM GENE, encodes a VGAM1144 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1144 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1144 precursor RNA is designated SEQ ID:1130, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1130 is located at position 502 relative to the genome of Bamboo mosaic virus.

[15973] VGAM1144 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1144 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15974] An enzyme complex designated DICER COMPLEX, dices the VGAM1144 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1144 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1144 RNA is designated SEQ ID:3855, and is provided hereinbelow with reference to the sequence listing part.

[15975] VGAM1144 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1144 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1144 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15976] VGAM1144 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1144 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1144 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1144 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1144 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15977] The complementary binding of VGAM1144 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1144 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1144 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1144 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15978] It is appreciated that VGAM1144 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1144 host target genes. The mRNA of each one of this plurality of VGAM1144 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1144 RNA, herein designated VGAM RNA, and which when bound by VGAM1144 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1144 host target proteins.

[15979] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1144 gene, herein designated VGAM GENE, on one or more VGAM1144 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15980] It is yet further appreciated that a function of VGAM1144 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1144 include diagnosis, prevention and

treatment of viral infection by Bamboo mosaic virus. Specific functions, and accordingly utilities, of VGAM1144 correlate with, and may be deduced from, the identity of the host target genes which VGAM1144 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15981] Nucleotide sequences of the VGAM1144 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1144 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1144 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1144 are further described hereinbelow with reference to Table 1.

[15982] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1144 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15983] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1145 (VGAM1145) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15984] VGAM1145 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1145 was detected is described hereinabove with reference to Figs. 2–8.

[15985] VGAM1145 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bamboo mosaic virus. VGAM1145 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15986] VGAM1145 gene, herein designated VGAM GENE, encodes a VGAM1145 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1145 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1145 precursor RNA is designated SEQ ID:1131, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1131 is located at position 5368 relative to the genome of Bamboo mosaic virus.

[15987] VGAM1145 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1145 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15988] An enzyme complex designated DICER COMPLEX, dices the VGAM1145 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1145 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1145 RNA is designated SEQ ID:3856, and is provided hereinbelow with reference to the sequence listing part.

[15989] VGAM1145 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1145 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1145 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[15990] VGAM1145 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1145 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1145 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1145 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1145 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[15991] The complementary binding of VGAM1145 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1145 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1145 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1145 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15992] It is appreciated that VGAM1145 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1145 host target genes. The mRNA of each one of this plurality of VGAM1145 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1145 RNA, herein designated VGAM

RNA, and which when bound by VGAM1145 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1145 host target proteins.

[15993] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1145 gene, herein designated VGAM GENE, on one or more VGAM1145 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[15994] It is yet further appreciated that a function of VGAM1145 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1145 include diagnosis, prevention and treatment of viral infection by Bamboo mosaic virus. Specific functions, and accordingly utilities, of VGAM1145 correlate with, and may be deduced from, the identity of the host target genes which VGAM1145 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15995] Nucleotide sequences of the VGAM1145 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1145 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1145 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1145 are further described hereinbelow with reference to Table 1.

[15996] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1145 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15997] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1146 (VGAM1146) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15998] VGAM1146 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1146 was detected is described hereinabove with reference to Figs. 2-8.

[15999] VGAM1146 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM1146 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16000] VGAM1146 gene, herein designated VGAM GENE, encodes a VGAM1146 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1146 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1146 precursor RNA is designated SEQ ID:1132, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1132 is located at position

218150 relative to the genome of Fowlpox virus.

[16001] VGAM1146 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1146 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16002] An enzyme complex designated DICER COMPLEX, dices the VGAM1146 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1146 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1146 RNA is designated SEQ ID:3857, and is provided hereinbelow with reference to the sequence listing part.

[16003] VGAM1146 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1146 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1146 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16004] VGAM1146 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1146 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1146 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1146 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1146 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16005] The complementary binding of VGAM1146 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1146 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1146 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1146 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16006] It is appreciated that VGAM1146 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1146 host target genes. The mRNA of each one of this plurality of VGAM1146 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1146 RNA, herein designated VGAM RNA, and which when bound by VGAM1146 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1146 host target proteins.

[16007] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1146 gene, herein designated VGAM GENE, on one or more VGAM1146 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16008] It is yet further appreciated that a function of VGAM1146 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1146 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM1146 correlate with, and may be deduced from, the identity of the host target genes which VGAM1146 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16009] Nucleotide sequences of the VGAM1146 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1146 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1146 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1146 are further described hereinbelow with reference to Table 1.

[16010] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1146 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16011] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1147 (VGAM1147) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16012] VGAM1147 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1147 was detected is described hereinabove with reference to Figs. 2–8.

[16013] VGAM1147 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM1147 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16014] VGAM1147 gene, herein designated VGAM GENE, encodes a VGAM1147 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1147 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1147 precursor RNA is designated SEQ ID:1133, and is provided hereinbelow with reference to the sequence listing part. Nu–

cleotide sequence SEQ ID:1133 is located at position 216748 relative to the genome of Fowlpox virus.

[16015] VGAM1147 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1147 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16016] An enzyme complex designated DICER COMPLEX, dices the VGAM1147 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1147 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM1147 RNA is designated SEQ ID:3858, and is provided hereinbelow with reference to the sequence

listing part.

[16017] VGAM1147 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1147 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1147 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16018] VGAM1147 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1147 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1147 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1147 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1147 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16019] The complementary binding of VGAM1147 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1147 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1147 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1147 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16020] It is appreciated that VGAM1147 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1147 host target genes. The mRNA of each one of this plurality of VGAM1147 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1147 RNA, herein designated VGAM RNA, and which when bound by VGAM1147 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1147 host target proteins.

[16021] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1147 gene, herein designated VGAM GENE, on one or more VGAM1147 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16022] It is yet further appreciated that a function of VGAM1147

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1147 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM1147 correlate with, and may be deduced from, the identity of the host target genes which VGAM1147 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16023] Nucleotide sequences of the VGAM1147 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1147 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1147 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1147 are further described hereinbelow with reference to Table 1.

[16024] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1147 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16025] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1148 (VGAM1148) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16026] VGAM1148 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1148 was detected is described hereinabove with reference to Figs. 2–8.

[16027] VGAM1148 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM1148 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16028] VGAM1148 gene, herein designated VGAM GENE, encodes a VGAM1148 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1148 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1148 precursor RNA is designated SEQ ID:1134, and is provided here–

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1134 is located at position 73086 relative to the genome of Cercopithecine herpesvirus 7.

[16029] VGAM1148 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1148 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16030] An enzyme complex designated DICER COMPLEX, dices the VGAM1148 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1148 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide se-

quence of VGAM1148 RNA is designated SEQ ID:3859, and is provided hereinbelow with reference to the sequence listing part.

[16031] VGAM1148 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1148 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1148 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16032] VGAM1148 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1148 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1148 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1148 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1148 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16033] The complementary binding of VGAM1148 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1148 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1148 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1148 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16034] It is appreciated that VGAM1148 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1148 host target genes. The mRNA of

each one of this plurality of VGAM1148 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1148 RNA, herein designated VGAM RNA, and which when bound by VGAM1148 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1148 host target proteins.

[16035] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1148 gene, herein designated VGAM GENE, on one or more VGAM1148 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[16036] It is yet further appreciated that a function of VGAM1148 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1148 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1148 correlate with, and may be deduced from, the identity of the host target genes which VGAM1148 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16037] Nucleotide sequences of the VGAM1148 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1148 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1148 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1148 are further described hereinbelow with reference to Table 1.

[16038] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1148 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[16039] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1149 (VGAM1149) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16040] VGAM1149 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1149 was detected is described hereinabove with reference to Figs. 2–8.

[16041] VGAM1149 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM1149 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16042] VGAM1149 gene, herein designated VGAM GENE, encodes a VGAM1149 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1149 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1149 precursor RNA is designated SEQ ID:1135, and is provided herein below with reference to the sequence listing part. Nucleotide sequence SEQ ID:1135 is located at position 75465 relative to the genome of Cercopithecine herpesvirus 7.

[16043] VGAM1149 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1149 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16044] An enzyme complex designated DICER COMPLEX, dices the VGAM1149 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1149 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1149 RNA is designated SEQ ID:3860, and is provided hereinbelow with reference to the sequence listing part.

[16045] VGAM1149 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1149 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1149 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16046] VGAM1149 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1149 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1149 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1149 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1149 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16047] The complementary binding of VGAM1149 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1149 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1149 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1149 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16048] It is appreciated that VGAM1149 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1149 host target genes. The mRNA of each one of this plurality of VGAM1149 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1149 RNA, herein designated VGAM RNA, and which when bound by VGAM1149 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1149 host target proteins.

[16049] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1149 gene, herein designated VGAM GENE, on one or more VGAM1149 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16050] It is yet further appreciated that a function of VGAM1149 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1149 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1149 correlate with, and may be deduced from, the identity of the host target genes which VGAM1149 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16051] Nucleotide sequences of the VGAM1149 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1149 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1149 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1149 are further described hereinbelow with reference to Table 1.

[16052] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1149 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16053] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1150 (VGAM1150) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16054] VGAM1150 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1150 was detected is described hereinabove with reference to Figs. 2–8.

[16055] VGAM1150 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM1150 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16056] VGAM1150 gene, herein designated VGAM GENE, encodes a VGAM1150 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1150 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1150 precursor RNA is designated SEQ ID:1136, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1136 is located at position 76231 relative to the genome of Cercopithecine herpesvirus 7.

[16057] VGAM1150 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1150 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16058] An enzyme complex designated DICER COMPLEX, dices the VGAM1150 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1150 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1150 RNA is designated SEQ ID:3861, and is provided hereinbelow with reference to the sequence listing part.

[16059] VGAM1150 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1150 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1150 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16060] VGAM1150 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1150 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1150 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1150 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1150 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16061] The complementary binding of VGAM1150 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1150 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1150 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1150 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[16062] It is appreciated that VGAM1150 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1150 host target genes. The mRNA of each one of this plurality of VGAM1150 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1150 RNA, herein designated VGAM RNA, and which when bound by VGAM1150 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1150 host target proteins.

[16063] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1150 gene, herein designated VGAM GENE, on one or more VGAM1150 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16064] It is yet further appreciated that a function of VGAM1150 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1150 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1150 correlate with, and may be deduced from, the identity of the host target genes which VGAM1150 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16065] Nucleotide sequences of the VGAM1150 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1150 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1150 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1150 are further described hereinbelow with reference to Table 1.

[16066] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1150 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16067] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1151 (VGAM1151) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16068] VGAM1151 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1151 was detected is described hereinabove with reference to Figs. 2-8.

[16069] VGAM1151 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.

VGAM1151 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16070] VGAM1151 gene, herein designated VGAM GENE, encodes a VGAM1151 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1151 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1151 precursor RNA is designated SEQ ID:1137, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1137 is located at position 2018 relative to the genome of Cowpox virus.

[16071] VGAM1151 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1151 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16072] An enzyme complex designated DICER COMPLEX, dices the VGAM1151 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1151 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM1151 RNA is designated SEQ ID:3862, and is provided hereinbelow with reference to the sequence listing part.

[16073] VGAM1151 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1151 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1151 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16074] VGAM1151 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1151 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1151 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1151 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1151 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16075] The complementary binding of VGAM1151 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1151 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1151 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1151 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16076] It is appreciated that VGAM1151 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1151 host target genes. The mRNA of each one of this plurality of VGAM1151 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1151 RNA, herein designated VGAM RNA, and which when bound by VGAM1151 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1151 host target proteins.

[16077] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1151 gene, herein designated VGAM GENE, on one or more VGAM1151 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16078] It is yet further appreciated that a function of VGAM1151 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1151 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM1151 correlate with, and may be deduced from, the identity of the host target genes which VGAM1151 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16079] Nucleotide sequences of the VGAM1151 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1151 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1151 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1151 are further described hereinbelow with reference to Table 1.

[16080] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1151 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16081] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1152 (VGAM1152) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16082] VGAM1152 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1152 was detected is described hereinabove with reference to Figs. 2-8.

[16083] VGAM1152 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.

VGAM1152 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16084] VGAM1152 gene, herein designated VGAM GENE, encodes

a VGAM1152 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1152 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1152 precursor RNA is designated SEQ ID:1138, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1138 is located at position 4584 relative to the genome of Cowpox virus.

[16085] VGAM1152 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1152 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16086] An enzyme complex designated DICER COMPLEX, dices the VGAM1152 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1152 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM1152 RNA is designated SEQ ID:3863, and is provided hereinbelow with reference to the sequence listing part.

[16087] VGAM1152 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1152 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1152 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16088] VGAM1152 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1152 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1152 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1152 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1152 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16089] The complementary binding of VGAM1152 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1152 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1152 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1152 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16090] It is appreciated that VGAM1152 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1152 host target genes. The mRNA of each one of this plurality of VGAM1152 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1152 RNA, herein designated VGAM RNA, and which when bound by VGAM1152 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1152 host target proteins.

[16091] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1152 gene, herein designated VGAM GENE, on one or more VGAM1152 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16092] It is yet further appreciated that a function of VGAM1152 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1152 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM1152 correlate with, and may be deduced from, the identity of the host target genes which VGAM1152 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16093] Nucleotide sequences of the VGAM1152 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1152 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1152 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1152 are further

described hereinbelow with reference to Table 1.

[16094] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1152 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16095] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1153 (VGAM1153) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16096] VGAM1153 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1153 was detected is described hereinabove with reference to Figs. 2-8.

[16097] VGAM1153 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus. VGAM1153 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16098] VGAM1153 gene, herein designated VGAM GENE, encodes a VGAM1153 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1153 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1153 precursor RNA is designated SEQ ID:1139, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1139 is located at position 2676 relative to the genome of Cowpox virus.

[16099] VGAM1153 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1153 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16100] An enzyme complex designated DICER COMPLEX, dices the VGAM1153 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1153 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM1153 RNA is designated SEQ ID:3864, and is provided hereinbelow with reference to the sequence listing part.

[16101] VGAM1153 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1153 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1153 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16102] VGAM1153 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1153 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1153 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1153 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1153 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16103] The complementary binding of VGAM1153 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1153 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1153

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1153 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16104] It is appreciated that VGAM1153 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1153 host target genes. The mRNA of each one of this plurality of VGAM1153 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1153 RNA, herein designated VGAM RNA, and which when bound by VGAM1153 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1153 host target proteins.

[16105] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1153 gene, herein designated VGAM GENE, on one or more VGAM1153 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16106] It is yet further appreciated that a function of VGAM1153 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1153 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM1153 correlate with, and may be deduced from, the identity of the host target genes which VGAM1153 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16107] Nucleotide sequences of the VGAM1153 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1153 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1153 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1153 are further described hereinbelow with reference to Table 1.

[16108] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1153 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16109] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1154 (VGAM1154) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16110] VGAM1154 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1154 was detected is described hereinabove with reference to Figs. 2-8.

[16111] VGAM1154 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.

VGAM1154 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[16112] VGAM1154 gene, herein designated VGAM GENE, encodes a VGAM1154 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1154 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1154 precursor RNA is designated SEQ ID:1140, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1140 is located at position 1704 relative to the genome of Cowpox virus.

[16113] VGAM1154 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1154 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16114] An enzyme complex designated DICER COMPLEX, dices

the VGAM1154 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1154 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1154 RNA is designated SEQ ID:3865, and is provided hereinbelow with reference to the sequence listing part.

[16115] VGAM1154 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1154 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1154 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16116] VGAM1154 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1154 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1154 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1154 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1154 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16117] The complementary binding of VGAM1154 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1154 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1154 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1154 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16118] It is appreciated that VGAM1154 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1154 host target genes. The mRNA of each one of this plurality of VGAM1154 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1154 RNA, herein designated VGAM RNA, and which when bound by VGAM1154 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1154 host target proteins.

[16119] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1154 gene, herein designated VGAM GENE, on one or more VGAM1154 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16120] It is yet further appreciated that a function of VGAM1154 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1154 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM1154 correlate with, and may be deduced from, the identity of the host target genes which VGAM1154 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16121] Nucleotide sequences of the VGAM1154 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1154 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1154 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1154 are further described hereinbelow with reference to Table 1.

[16122] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1154 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16123] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1155 (VGAM1155) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16124] VGAM1155 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1155 was detected is described hereinabove with reference to Figs. 2-8.

[16125] VGAM1155 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.

VGAM1155 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[16126] VGAM1155 gene, herein designated VGAM GENE, encodes a VGAM1155 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1155 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1155 precursor RNA is designated SEQ ID:1141, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1141 is located at position 147349 relative to the genome of Cowpox virus.

[16127] VGAM1155 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1155 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16128] An enzyme complex designated DICER COMPLEX, dices the VGAM1155 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1155 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1155 RNA is designated SEQ ID:3866, and is provided hereinbelow with reference to the sequence listing part.

[16129] VGAM1155 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1155 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1155 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16130] VGAM1155 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1155 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1155 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1155 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1155 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16131] The complementary binding of VGAM1155 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1155 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1155 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1155 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16132] It is appreciated that VGAM1155 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1155 host target genes. The mRNA of each one of this plurality of VGAM1155 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1155 RNA, herein designated VGAM RNA, and which when bound by VGAM1155 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1155 host target proteins.

[16133] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1155 gene, herein designated VGAM GENE, on one or more VGAM1155 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16134] It is yet further appreciated that a function of VGAM1155 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1155 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM1155 correlate with, and may be deduced from, the identity of the host target genes which VGAM1155 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16135] Nucleotide sequences of the VGAM1155 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1155 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1155 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1155 are further described hereinbelow with reference to Table 1.

[16136] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1155 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16137] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1156 (VGAM1156) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16138] VGAM1156 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1156 was detected is described hereinabove with reference to Figs. 2-8.

[16139] VGAM1156 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus.

VGAM1156 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16140] VGAM1156 gene, herein designated VGAM GENE, encodes a VGAM1156 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1156 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1156 precursor RNA is designated SEQ ID:1142, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1142 is located at position 134779 relative to the genome of Camelpox virus.

[16141] VGAM1156 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1156 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[16142] An enzyme complex designated DICER COMPLEX, dices the VGAM1156 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1156 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM1156 RNA is designated SEQ ID:3867, and is provided hereinbelow with reference to the sequence listing part.

[16143] VGAM1156 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1156 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1156 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16144] VGAM1156 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1156 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1156 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1156 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1156 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16145] The complementary binding of VGAM1156 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1156 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1156 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1156 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16146] It is appreciated that VGAM1156 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1156 host target genes. The mRNA of each one of this plurality of VGAM1156 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1156 RNA, herein designated VGAM RNA, and which when bound by VGAM1156 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1156 host target proteins.

[16147] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1156 gene, herein designated VGAM GENE, on one or more VGAM1156 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16148] It is yet further appreciated that a function of VGAM1156 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1156 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1156 correlate with, and may be deduced from, the identity of the host target genes which VGAM1156 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16149] Nucleotide sequences of the VGAM1156 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1156 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1156 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1156 are further described hereinbelow with reference to Table 1.

[16150] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1156 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16151] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1157 (VGAM1157) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16152] VGAM1157 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1157 was detected is described hereinabove with reference to Figs. 2-8.

[16153] VGAM1157 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Camelpox virus.

VGAM1157 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16154] VGAM1157 gene, herein designated VGAM GENE, encodes a VGAM1157 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1157 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1157 precursor RNA is designated SEQ ID:1143, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1143 is located at position 135685 relative to the genome of Camelpox virus.

[16155] VGAM1157 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1157 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16156] An enzyme complex designated DICER COMPLEX, dices the VGAM1157 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1157 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1157 RNA is designated SEQ ID:3868, and is provided hereinbelow with reference to the sequence listing part.

[16157] VGAM1157 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1157 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1157 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16158] VGAM1157 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1157 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1157 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1157 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1157 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16159] The complementary binding of VGAM1157 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1157 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1157 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1157 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16160] It is appreciated that VGAM1157 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1157 host target genes. The mRNA of each one of this plurality of VGAM1157 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1157 RNA, herein designated VGAM RNA, and which when bound by VGAM1157 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1157 host target proteins.

[16161] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1157 gene, herein designated VGAM GENE, on one or more VGAM1157 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16162] It is yet further appreciated that a function of VGAM1157 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1157 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1157 correlate with, and may be deduced from, the identity of the host target genes which VGAM1157 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16163] Nucleotide sequences of the VGAM1157 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1157 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1157 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1157 are further described hereinbelow with reference to Table 1.

[16164] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1157 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16165] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1158 (VGAM1158) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16166] VGAM1158 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1158 was detected is described hereinabove with reference to Figs. 2-8.

[16167] VGAM1158 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Swinepox virus.

VGAM1158 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16168] VGAM1158 gene, herein designated VGAM GENE, encodes a VGAM1158 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1158 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1158 precursor RNA is designated SEQ ID:1144, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1144 is located at position 104200 relative to the genome of Swinepox virus.

[16169] VGAM1158 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1158 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16170] An enzyme complex designated DICER COMPLEX, dices the VGAM1158 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1158 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1158 RNA is designated SEQ ID:3869, and is provided hereinbelow with reference to the sequence listing part.

[16171] VGAM1158 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1158 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1158 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[16172] VGAM1158 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1158 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1158 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1158 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1158 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16173] The complementary binding of VGAM1158 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1158 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1158 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1158 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16174] It is appreciated that VGAM1158 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1158 host target genes. The mRNA of each one of this plurality of VGAM1158 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1158 RNA, herein designated VGAM RNA, and which when bound by VGAM1158 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1158 host target proteins.

[16175] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1158 gene, herein designated VGAM GENE, on one

or more VGAM1158 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16176] It is yet further appreciated that a function of VGAM1158 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1158 include diagnosis, prevention and treatment of viral infection by Swinepox virus. Specific functions, and accordingly utilities, of VGAM1158 correlate with, and may be deduced from, the identity of the host target genes which VGAM1158 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16177] Nucleotide sequences of the VGAM1158 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1158 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1158 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1158 are further described hereinbelow with reference to Table 1.

[16178] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1158 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16179] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1159 (VGAM1159) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16180] VGAM1159 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1159 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[16181] VGAM1159 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM1159 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16182] VGAM1159 gene, herein designated VGAM GENE, encodes a VGAM1159 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1159 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1159 precursor RNA is designated SEQ ID:1145, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1145 is located at position 38413 relative to the genome of Meleagrid herpesvirus 1.

[16183] VGAM1159 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1159 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16184] An enzyme complex designated DICER COMPLEX, dices the VGAM1159 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1159 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM1159 RNA is designated SEQ ID:3870, and is provided hereinbelow with reference to the sequence listing part.

[16185] VGAM1159 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1159 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1159 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16186] VGAM1159 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1159 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1159 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1159 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1159 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[16187] The complementary binding of VGAM1159 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1159 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1159 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1159 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16188] It is appreciated that VGAM1159 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1159 host target genes. The mRNA of each one of this plurality of VGAM1159 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1159 RNA, herein designated VGAM RNA, and which when bound by VGAM1159 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1159 host target proteins.

[16189] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1159 gene, herein designated VGAM GENE, on one or more VGAM1159 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16190] It is yet further appreciated that a function of VGAM1159 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1159 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1159 correlate with, and may be deduced from, the identity of the host target genes which VGAM1159 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[16191] Nucleotide sequences of the VGAM1159 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1159 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1159 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1159 are further described hereinbelow with reference to Table 1.

[16192] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1159 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16193] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1160 (VGAM1160) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16194] VGAM1160 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1160 was detected is described hereinabove with reference to Figs. 2–8.

[16195] VGAM1160 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM1160 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16196] VGAM1160 gene, herein designated VGAM GENE, encodes a VGAM1160 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1160 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1160 precursor RNA is designated SEQ ID:1146, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1146 is located at position 39108 relative to the genome of Meleagrid herpesvirus 1.

[16197] VGAM1160 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1160 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16198] An enzyme complex designated DICER COMPLEX, dices the VGAM1160 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1160 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of VGAM1160 RNA is designated SEQ ID:3871, and is provided hereinbelow with reference to the sequence listing part.

[16199] VGAM1160 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1160 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1160 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16200] VGAM1160 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1160 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1160 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1160 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1160 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16201] The complementary binding of VGAM1160 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1160 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1160 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1160 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16202] It is appreciated that VGAM1160 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1160 host target genes. The mRNA of each one of this plurality of VGAM1160 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1160 RNA, herein designated VGAM RNA, and which when bound by VGAM1160 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1160 host target proteins.

[16203] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1160 gene, herein designated VGAM GENE, on one or more VGAM1160 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16204] It is yet further appreciated that a function of VGAM1160 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1160 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1160 correlate with, and may be deduced from, the identity of the host target genes which VGAM1160 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[16205] Nucleotide sequences of the VGAM1160 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1160 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1160 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1160 are further described hereinbelow with reference to Table 1.

[16206] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1160 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16207] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1161 (VGAM1161) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16208] VGAM1161 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1161 was detected is described hereinabove with reference to Figs. 2–8.

[16209] VGAM1161 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM1161 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16210] VGAM1161 gene, herein designated VGAM GENE, encodes a VGAM1161 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1161 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1161 precursor RNA is designated SEQ ID:1147, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1147 is located at position 38258 relative to the genome of Meleagrid herpesvirus 1.

[16211] VGAM1161 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1161 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16212] An enzyme complex designated DICER COMPLEX, dices the VGAM1161 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1161 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1161 RNA is designated SEQ ID:3872, and is provided hereinbelow with reference to the sequence listing part.

[16213] VGAM1161 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1161 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1161 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16214] VGAM1161 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1161 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1161 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1161 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1161 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16215] The complementary binding of VGAM1161 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1161 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1161 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1161 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16216] It is appreciated that VGAM1161 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1161 host target genes. The mRNA of each one of this plurality of VGAM1161 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1161 RNA, herein designated VGAM RNA, and which when bound by VGAM1161 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1161 host target proteins.

[16217] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1161 gene, herein designated VGAM GENE, on one or more VGAM1161 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16218] It is yet further appreciated that a function of VGAM1161 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1161 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1161 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1161 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16219] Nucleotide sequences of the VGAM1161 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1161 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1161 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1161 are further described hereinbelow with reference to Table 1.

[16220] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1161 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16221] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1162 (VGAM1162) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16222] VGAM1162 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1162 was detected is described hereinabove with reference to Figs. 2-8.

[16223] VGAM1162 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM1162 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16224] VGAM1162 gene, herein designated VGAM GENE, encodes a VGAM1162 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1162 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1162 precursor RNA is designated SEQ ID:1148, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1148 is located at position 139277 relative to the genome of Ectromelia virus.

[16225] VGAM1162 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1162 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16226] An enzyme complex designated DICER COMPLEX, dices the VGAM1162 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1162 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM1162 RNA is designated SEQ ID:3873, and is provided hereinbelow with reference to the sequence listing part.

[16227] VGAM1162 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1162 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1162 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16228] VGAM1162 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1162 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1162 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1162 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1162 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16229] The complementary binding of VGAM1162 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1162 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1162 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1162 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16230] It is appreciated that VGAM1162 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1162 host target genes. The mRNA of each one of this plurality of VGAM1162 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1162 RNA, herein designated VGAM RNA, and which when bound by VGAM1162 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1162 host target proteins.

[16231] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1162 gene, herein designated VGAM GENE, on one or more VGAM1162 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16232] It is yet further appreciated that a function of VGAM1162 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1162 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM1162 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM1162 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16233] Nucleotide sequences of the VGAM1162 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1162 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1162 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1162 are further described hereinbelow with reference to Table 1.

[16234] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1162 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16235] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1163 (VGAM1163) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[16236] VGAM1163 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1163 was detected is described hereinabove with reference to Figs. 2–8.

[16237] VGAM1163 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM1163 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16238] VGAM1163 gene, herein designated VGAM GENE, encodes a VGAM1163 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1163 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1163 precursor RNA is designated SEQ ID:1149, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1149 is located at position 140623 relative to the genome of Ectromelia virus.

[16239] VGAM1163 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1163 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16240] An enzyme complex designated DICER COMPLEX, dices the VGAM1163 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1163 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM1163 RNA is designated SEQ ID:3874, and is provided hereinbelow with reference to the sequence listing part.

[16241] VGAM1163 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1163 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1163 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16242] VGAM1163 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1163 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1163 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1163 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1163 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16243] The complementary binding of VGAM1163 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1163 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1163 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1163 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16244] It is appreciated that VGAM1163 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1163 host target genes. The mRNA of each one of this plurality of VGAM1163 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1163 RNA, herein designated VGAM RNA, and which when bound by VGAM1163 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1163 host target proteins.

[16245] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1163 gene, herein designated VGAM GENE, on one or more VGAM1163 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16246] It is yet further appreciated that a function of VGAM1163 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1163 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific

functions, and accordingly utilities, of VGAM1163 correlate with, and may be deduced from, the identity of the host target genes which VGAM1163 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16247] Nucleotide sequences of the VGAM1163 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1163 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1163 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1163 are further described hereinbelow with reference to Table 1.

[16248] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1163 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16249] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1164 (VGAM1164) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[16250] VGAM1164 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1164 was detected is described hereinabove with reference to Figs. 2–8.

[16251] VGAM1164 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM1164 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16252] VGAM1164 gene, herein designated VGAM GENE, encodes a VGAM1164 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1164 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1164 precursor RNA is designated SEQ ID:1150, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1150 is located at position 135687 relative to the genome of Camelpox virus.

[16253] VGAM1164 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1164 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16254] An enzyme complex designated DICER COMPLEX, dices the VGAM1164 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1164 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1164 RNA is designated SEQ ID:3875, and is provided hereinbelow with reference to the sequence listing part.

[16255] VGAM1164 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1164 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1164 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16256] VGAM1164 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1164 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1164 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1164 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1164 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16257] The complementary binding of VGAM1164 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1164 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1164 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1164 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16258] It is appreciated that VGAM1164 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1164 host target genes. The mRNA of each one of this plurality of VGAM1164 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1164 RNA, herein designated VGAM RNA, and which when bound by VGAM1164 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1164 host target proteins.

[16259] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1164 gene, herein designated VGAM GENE, on one or more VGAM1164 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16260] It is yet further appreciated that a function of VGAM1164 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1164 include diagnosis, prevention and

treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1164 correlate with, and may be deduced from, the identity of the host target genes which VGAM1164 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16261] Nucleotide sequences of the VGAM1164 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1164 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1164 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1164 are further described hereinbelow with reference to Table 1.

[16262] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1164 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16263] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1165 (VGAM1165) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16264] VGAM1165 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1165 was detected is described hereinabove with reference to Figs. 2–8.

[16265] VGAM1165 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM1165 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16266] VGAM1165 gene, herein designated VGAM GENE, encodes a VGAM1165 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1165 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1165 precursor RNA is designated SEQ ID:1151, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1151 is located at position 141338 relative to the genome of Ectromelia virus.

[16267] VGAM1165 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1165 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16268] An enzyme complex designated DICER COMPLEX, dices the VGAM1165 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1165 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM1165 RNA is designated SEQ ID:3876, and is provided hereinbelow with reference to the sequence listing part.

[16269] VGAM1165 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1165 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1165 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16270] VGAM1165 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1165 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1165 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1165 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1165 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16271] The complementary binding of VGAM1165 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1165 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1165 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1165 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16272] It is appreciated that VGAM1165 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1165 host target genes. The mRNA of each one of this plurality of VGAM1165 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1165 RNA, herein designated VGAM

RNA, and which when bound by VGAM1165 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1165 host target proteins.

[16273] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1165 gene, herein designated VGAM GENE, on one or more VGAM1165 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16274] It is yet further appreciated that a function of VGAM1165 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1165 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM1165 correlate with, and may be deduced from, the identity of the host target genes which VGAM1165 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16275] Nucleotide sequences of the VGAM1165 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1165 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1165 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1165 are further described hereinbelow with reference to Table 1.

[16276] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1165 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16277] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1166 (VGAM1166) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16278] VGAM1166 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1166 was detected is described hereinabove with reference to Figs. 2-8.

[16279] VGAM1166 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cucumber green mottle mosaic virus. VGAM1166 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16280] VGAM1166 gene, herein designated VGAM GENE, encodes a VGAM1166 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1166 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1166 precursor RNA is designated SEQ ID:1152, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1152 is located at position 2881

relative to the genome of Cucumber green mottle mosaic virus.

[16281] VGAM1166 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1166 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16282] An enzyme complex designated DICER COMPLEX, dices the VGAM1166 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1166 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1166 RNA is designated SEQ ID:3877, and is provided hereinbelow with reference to the sequence

listing part.

[16283] VGAM1166 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1166 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1166 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16284] VGAM1166 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1166 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1166 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1166 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1166 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16285] The complementary binding of VGAM1166 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1166 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1166 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1166 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16286] It is appreciated that VGAM1166 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1166 host target genes. The mRNA of each one of this plurality of VGAM1166 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1166 RNA, herein designated VGAM RNA, and which when bound by VGAM1166 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1166 host target proteins.

[16287] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1166 gene, herein designated VGAM GENE, on one or more VGAM1166 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16288] It is yet further appreciated that a function of VGAM1166

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1166 include diagnosis, prevention and treatment of viral infection by Cucumber green mottle mosaic virus. Specific functions, and accordingly utilities, of VGAM1166 correlate with, and may be deduced from, the identity of the host target genes which VGAM1166 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16289] Nucleotide sequences of the VGAM1166 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1166 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1166 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1166 are further described hereinbelow with reference to Table 1.

[16290] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1166 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16291] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1167 (VGAM1167) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16292] VGAM1167 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1167 was detected is described hereinabove with reference to Figs. 2–8.

[16293] VGAM1167 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cucumber green mottle mosaic virus. VGAM1167 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16294] VGAM1167 gene, herein designated VGAM GENE, encodes a VGAM1167 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1167 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1167 precursor RNA is designated SEQ ID:1153, and is provided here–

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1153 is located at position 2385 relative to the genome of Cucumber green mottle mosaic virus.

[16295] VGAM1167 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1167 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16296] An enzyme complex designated DICER COMPLEX, dices the VGAM1167 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1167 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide se-

quence of VGAM1167 RNA is designated SEQ ID:3878, and is provided hereinbelow with reference to the sequence listing part.

[16297] VGAM1167 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1167 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1167 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16298] VGAM1167 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1167 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1167 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1167 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1167 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16299] The complementary binding of VGAM1167 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1167 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1167 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1167 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16300] It is appreciated that VGAM1167 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1167 host target genes. The mRNA of

each one of this plurality of VGAM1167 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1167 RNA, herein designated VGAM RNA, and which when bound by VGAM1167 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1167 host target proteins.

[16301] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1167 gene, herein designated VGAM GENE, on one or more VGAM1167 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[16302] It is yet further appreciated that a function of VGAM1167 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1167 include diagnosis, prevention and treatment of viral infection by Cucumber green mottle mosaic virus. Specific functions, and accordingly utilities, of VGAM1167 correlate with, and may be deduced from, the identity of the host target genes which VGAM1167 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16303] Nucleotide sequences of the VGAM1167 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1167 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1167 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1167 are further described hereinbelow with reference to Table 1.

[16304] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1167 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[16305] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1168 (VGAM1168) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16306] VGAM1168 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1168 was detected is described hereinabove with reference to Figs. 2–8.

[16307] VGAM1168 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM1168 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16308] VGAM1168 gene, herein designated VGAM GENE, encodes a VGAM1168 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1168 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1168 precursor RNA is designated SEQ ID:1154, and is provided herein below with reference to the sequence listing part. Nucleotide sequence SEQ ID:1154 is located at position 92139 relative to the genome of *Rana tigrina* ranavirus.

[16309] VGAM1168 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1168 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16310] An enzyme complex designated DICER COMPLEX, dices the VGAM1168 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1168 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1168 RNA is designated SEQ ID:3879, and is provided hereinbelow with reference to the sequence listing part.

[16311] VGAM1168 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1168 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1168 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16312] VGAM1168 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1168 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1168 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1168 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1168 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16313] The complementary binding of VGAM1168 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1168 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1168 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1168 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16314] It is appreciated that VGAM1168 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1168 host target genes. The mRNA of each one of this plurality of VGAM1168 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1168 RNA, herein designated VGAM RNA, and which when bound by VGAM1168 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1168 host target proteins.

[16315] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1168 gene, herein designated VGAM GENE, on one or more VGAM1168 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [16316] It is yet further appreciated that a function of VGAM1168 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1168 include diagnosis, prevention and treatment of viral infection by *Rana tigrina* ranavirus. Specific functions, and accordingly utilities, of VGAM1168 correlate with, and may be deduced from, the identity of the host target genes which VGAM1168 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [16317] Nucleotide sequences of the VGAM1168 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM1168 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1168 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1168 are further described hereinbelow with reference to Table 1.
- [16318] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1168 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16319] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1169 (VGAM1169) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16320] VGAM1169 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1169 was detected is described hereinabove with reference to Figs. 2–8.

[16321] VGAM1169 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana tigrina ranavirus. VGAM1169 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16322] VGAM1169 gene, herein designated VGAM GENE, encodes a VGAM1169 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1169 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1169 precursor RNA is designated SEQ ID:1155, and is provided herein below with reference to the sequence listing part. Nucleotide sequence SEQ ID:1155 is located at position 92520 relative to the genome of Rana tigrina ranavirus.

[16323] VGAM1169 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1169 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16324] An enzyme complex designated DICER COMPLEX, dices the VGAM1169 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1169 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM1169 RNA is designated SEQ ID:3880, and is provided hereinbelow with reference to the sequence listing part.

[16325] VGAM1169 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1169 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1169 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16326] VGAM1169 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1169 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1169 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1169 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1169 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16327] The complementary binding of VGAM1169 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1169 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1169 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1169 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16328] It is appreciated that VGAM1169 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1169 host target genes. The mRNA of each one of this plurality of VGAM1169 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1169 RNA, herein designated VGAM

RNA, and which when bound by VGAM1169 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1169 host target proteins.

[16329] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1169 gene, herein designated VGAM GENE, on one or more VGAM1169 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16330] It is yet further appreciated that a function of VGAM1169 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1169 include diagnosis, prevention and treatment of viral infection by *Rana tigrina* ranavirus. Specific functions, and accordingly utilities, of VGAM1169 correlate with, and may be deduced from, the identity of the host target genes which VGAM1169 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16331] Nucleotide sequences of the VGAM1169 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1169 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1169 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1169 are further described hereinbelow with reference to Table 1.

[16332] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1169 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16333] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1170 (VGAM1170) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16334] VGAM1170 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1170 was detected is described hereinabove with reference to Figs. 2-8.

[16335] VGAM1170 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus sanguinipes entomopoxvirus. VGAM1170 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16336] VGAM1170 gene, herein designated VGAM GENE, encodes a VGAM1170 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1170 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1170 precursor RNA is designated SEQ ID:1156, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1156 is located at position

35824 relative to the genome of *Melanoplus sanguinipes* entomopoxvirus.

[16337] VGAM1170 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1170 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16338] An enzyme complex designated DICER COMPLEX, dices the VGAM1170 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1170 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1170 RNA is designated SEQ ID:3881, and is provided hereinbelow with reference to the sequence

listing part.

[16339] VGAM1170 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1170 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1170 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16340] VGAM1170 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1170 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1170 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1170 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1170 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16341] The complementary binding of VGAM1170 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1170 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1170 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1170 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16342] It is appreciated that VGAM1170 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1170 host target genes. The mRNA of each one of this plurality of VGAM1170 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1170 RNA, herein designated VGAM RNA, and which when bound by VGAM1170 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1170 host target proteins.

[16343] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1170 gene, herein designated VGAM GENE, on one or more VGAM1170 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16344] It is yet further appreciated that a function of VGAM1170

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1170 include diagnosis, prevention and treatment of viral infection by *Melanoplus sanguinipes* entomopoxvirus. Specific functions, and accordingly utilities, of VGAM1170 correlate with, and may be deduced from, the identity of the host target genes which VGAM1170 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16345] Nucleotide sequences of the VGAM1170 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1170 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1170 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1170 are further described hereinbelow with reference to Table 1.

[16346] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1170 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16347] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1171 (VGAM1171) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16348] VGAM1171 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1171 was detected is described hereinabove with reference to Figs. 2–8.

[16349] VGAM1171 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cucumber fruit mottle mosaic virus. VGAM1171 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16350] VGAM1171 gene, herein designated VGAM GENE, encodes a VGAM1171 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1171 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1171 precursor RNA is designated SEQ ID:1157, and is provided here–

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1157 is located at position 4341 relative to the genome of Cucumber fruit mottle mosaic virus.

[16351] VGAM1171 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1171 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16352] An enzyme complex designated DICER COMPLEX, dices the VGAM1171 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1171 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide se-

quence of VGAM1171 RNA is designated SEQ ID:3882, and is provided hereinbelow with reference to the sequence listing part.

[16353] VGAM1171 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1171 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1171 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16354] VGAM1171 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1171 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1171 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1171 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1171 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16355] The complementary binding of VGAM1171 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1171 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1171 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1171 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16356] It is appreciated that VGAM1171 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1171 host target genes. The mRNA of

each one of this plurality of VGAM1171 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1171 RNA, herein designated VGAM RNA, and which when bound by VGAM1171 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1171 host target proteins.

[16357] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1171 gene, herein designated VGAM GENE, on one or more VGAM1171 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[16358] It is yet further appreciated that a function of VGAM1171 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1171 include diagnosis, prevention and treatment of viral infection by Cucumber fruit mottle mosaic virus. Specific functions, and accordingly utilities, of VGAM1171 correlate with, and may be deduced from, the identity of the host target genes which VGAM1171 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16359] Nucleotide sequences of the VGAM1171 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1171 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1171 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1171 are further described hereinbelow with reference to Table 1.

[16360] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1171 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[16361] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1172 (VGAM1172) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16362] VGAM1172 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1172 was detected is described hereinabove with reference to Figs. 2–8.

[16363] VGAM1172 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cucumber fruit mottle mosaic virus. VGAM1172 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16364] VGAM1172 gene, herein designated VGAM GENE, encodes a VGAM1172 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1172 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1172 precursor RNA is designated SEQ ID:1158, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1158 is located at position 5778 relative to the genome of Cucumber fruit mottle mosaic virus.

[16365] VGAM1172 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1172 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16366] An enzyme complex designated DICER COMPLEX, dices the VGAM1172 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1172 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1172 RNA is designated SEQ ID:3883, and is provided hereinbelow with reference to the sequence listing part.

[16367] VGAM1172 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1172 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1172 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16368] VGAM1172 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1172 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1172 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1172 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1172 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16369] The complementary binding of VGAM1172 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1172 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1172 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1172 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16370] It is appreciated that VGAM1172 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1172 host target genes. The mRNA of each one of this plurality of VGAM1172 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1172 RNA, herein designated VGAM RNA, and which when bound by VGAM1172 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1172 host target proteins.

[16371] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1172 gene, herein designated VGAM GENE, on one or more VGAM1172 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16372] It is yet further appreciated that a function of VGAM1172 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1172 include diagnosis, prevention and treatment of viral infection by Cucumber fruit mottle mosaic virus. Specific functions, and accordingly utilities, of VGAM1172 correlate with, and may be deduced from, the identity of the host target genes which VGAM1172 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16373] Nucleotide sequences of the VGAM1172 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1172 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1172 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1172 are further described hereinbelow with reference to Table 1.

[16374] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1172 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16375] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1173 (VGAM1173) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16376] VGAM1173 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1173 was detected is described hereinabove with reference to Figs. 2–8.

[16377] VGAM1173 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cucumber fruit mottle mosaic virus. VGAM1173 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16378] VGAM1173 gene, herein designated VGAM GENE, encodes a VGAM1173 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1173 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1173 precursor RNA is designated SEQ ID:1159, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1159 is located at position 5471 relative to the genome of Cucumber fruit mottle mosaic virus.

[16379] VGAM1173 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1173 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16380] An enzyme complex designated DICER COMPLEX, dices the VGAM1173 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1173 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM1173 RNA is designated SEQ ID:3884, and is provided hereinbelow with reference to the sequence listing part.

[16381] VGAM1173 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1173 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1173 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16382] VGAM1173 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1173 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1173 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1173 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1173 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16383] The complementary binding of VGAM1173 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1173 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1173 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1173 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[16384] It is appreciated that VGAM1173 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1173 host target genes. The mRNA of each one of this plurality of VGAM1173 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1173 RNA, herein designated VGAM RNA, and which when bound by VGAM1173 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1173 host target proteins.

[16385] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1173 gene, herein designated VGAM GENE, on one or more VGAM1173 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16386] It is yet further appreciated that a function of VGAM1173 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1173 include diagnosis, prevention and treatment of viral infection by Cucumber fruit mottle mosaic virus. Specific functions, and accordingly utilities, of VGAM1173 correlate with, and may be deduced from, the identity of the host target genes which VGAM1173 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16387] Nucleotide sequences of the VGAM1173 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1173 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1173 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1173 are further described hereinbelow with reference to Table 1.

[16388] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1173 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16389] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1174 (VGAM1174) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16390] VGAM1174 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1174 was detected is described hereinabove with reference to Figs. 2-8.

[16391] VGAM1174 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rift Valley fever virus. VGAM1174 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16392] VGAM1174 gene, herein designated VGAM GENE, encodes a VGAM1174 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1174 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1174 precursor RNA is designated SEQ ID:1160, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1160 is located at position 4915 relative to the genome of Rift Valley fever virus.

[16393] VGAM1174 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1174 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16394] An enzyme complex designated DICER COMPLEX, dices the VGAM1174 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1174 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1174 RNA is designated SEQ ID:3885, and is provided hereinbelow with reference to the sequence listing part.

[16395] VGAM1174 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1174 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1174 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16396] VGAM1174 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1174 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1174 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1174 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1174 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16397] The complementary binding of VGAM1174 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1174 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1174 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1174 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16398] It is appreciated that VGAM1174 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1174 host target genes. The mRNA of each one of this plurality of VGAM1174 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1174 RNA, herein designated VGAM RNA, and which when bound by VGAM1174 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1174 host target proteins.

[16399] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1174 gene, herein designated VGAM GENE, on one or more VGAM1174 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16400] It is yet further appreciated that a function of VGAM1174 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1174 include diagnosis, prevention and treatment of viral infection by Rift Valley fever virus. Specific functions, and accordingly utilities, of VGAM1174 correlate with, and may be deduced from, the identity of the host target genes which VGAM1174 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16401] Nucleotide sequences of the VGAM1174 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1174 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1174 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1174 are further described hereinbelow with reference to Table 1.

[16402] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1174 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16403] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1175 (VGAM1175) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16404] VGAM1175 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1175 was detected is described hereinabove with reference to Figs. 2-8.

[16405] VGAM1175 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rift Valley fever virus. VGAM1175 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16406] VGAM1175 gene, herein designated VGAM GENE, encodes

a VGAM1175 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1175 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1175 precursor RNA is designated SEQ ID:1161, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1161 is located at position 5974 relative to the genome of Rift Valley fever virus.

[16407] VGAM1175 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1175 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16408] An enzyme complex designated DICER COMPLEX, dices the VGAM1175 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1175 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1175 RNA is designated SEQ ID:3886, and is provided hereinbelow with reference to the sequence listing part.

[16409] VGAM1175 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1175 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1175 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16410] VGAM1175 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1175 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1175 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1175 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1175 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16411] The complementary binding of VGAM1175 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1175 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1175 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1175 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16412] It is appreciated that VGAM1175 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1175 host target genes. The mRNA of each one of this plurality of VGAM1175 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1175 RNA, herein designated VGAM RNA, and which when bound by VGAM1175 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1175 host target proteins.

[16413] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1175 gene, herein designated VGAM GENE, on one or more VGAM1175 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16414] It is yet further appreciated that a function of VGAM1175 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1175 include diagnosis, prevention and treatment of viral infection by Rift Valley fever virus. Specific functions, and accordingly utilities, of VGAM1175 correlate with, and may be deduced from, the identity of the host target genes which VGAM1175 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16415] Nucleotide sequences of the VGAM1175 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1175 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1175 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1175 are further

described hereinbelow with reference to Table 1.

[16416] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1175 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16417] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1176 (VGAM1176) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16418] VGAM1176 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1176 was detected is described hereinabove with reference to Figs. 2-8.

[16419] VGAM1176 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rift Valley fever virus. VGAM1176 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16420] VGAM1176 gene, herein designated VGAM GENE, encodes a VGAM1176 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1176 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1176 precursor RNA is designated SEQ ID:1162, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1162 is located at position 2112 relative to the genome of Rift Valley fever virus.

[16421] VGAM1176 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1176 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16422] An enzyme complex designated DICER COMPLEX, dices the VGAM1176 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1176 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1176 RNA is designated SEQ ID:3887, and is provided hereinbelow with reference to the sequence listing part.

[16423] VGAM1176 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1176 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1176 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16424] VGAM1176 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1176 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1176 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1176 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1176 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16425] The complementary binding of VGAM1176 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1176 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1176

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1176 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16426] It is appreciated that VGAM1176 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1176 host target genes. The mRNA of each one of this plurality of VGAM1176 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1176 RNA, herein designated VGAM RNA, and which when bound by VGAM1176 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1176 host target proteins.

[16427] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1176 gene, herein designated VGAM GENE, on one or more VGAM1176 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16428] It is yet further appreciated that a function of VGAM1176 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1176 include diagnosis, prevention and treatment of viral infection by Rift Valley fever virus. Specific functions, and accordingly utilities, of VGAM1176 correlate with, and may be deduced from, the identity of the host target genes which VGAM1176 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16429] Nucleotide sequences of the VGAM1176 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1176 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1176 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1176 are further described hereinbelow with reference to Table 1.

[16430] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1176 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16431] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1177 (VGAM1177) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16432] VGAM1177 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1177 was detected is described hereinabove with reference to Figs. 2-8.

[16433] VGAM1177 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Odontoglossum ringspot virus. VGAM1177 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[16434] VGAM1177 gene, herein designated VGAM GENE, encodes a VGAM1177 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1177 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1177 precursor RNA is designated SEQ ID:1163, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1163 is located at position 4157 relative to the genome of Odontoglossum ringspot virus.

[16435] VGAM1177 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1177 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16436] An enzyme complex designated DICER COMPLEX, dices

the VGAM1177 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1177 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1177 RNA is designated SEQ ID:3888, and is provided hereinbelow with reference to the sequence listing part.

[16437] VGAM1177 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1177 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1177 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16438] VGAM1177 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1177 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1177 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1177 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1177 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16439] The complementary binding of VGAM1177 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1177 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1177 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1177 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16440] It is appreciated that VGAM1177 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1177 host target genes. The mRNA of each one of this plurality of VGAM1177 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1177 RNA, herein designated VGAM RNA, and which when bound by VGAM1177 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1177 host target proteins.

[16441] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1177 gene, herein designated VGAM GENE, on one or more VGAM1177 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16442] It is yet further appreciated that a function of VGAM1177 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1177 include diagnosis, prevention and treatment of viral infection by Odontoglossum ringspot virus. Specific functions, and accordingly utilities, of VGAM1177 correlate with, and may be deduced from, the identity of the host target genes which VGAM1177 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16443] Nucleotide sequences of the VGAM1177 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1177 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1177 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1177 are further described hereinbelow with reference to Table 1.

[16444] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1177 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16445] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1178 (VGAM1178) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16446] VGAM1178 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1178 was detected is described hereinabove with reference to Figs. 2-8.

[16447] VGAM1178 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Odontoglossum ringspot virus. VGAM1178 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16448] VGAM1178 gene, herein designated VGAM GENE, encodes a VGAM1178 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1178 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1178 precursor RNA is designated SEQ ID:1164, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1164 is located at position 5128 relative to the genome of Odontoglossum ringspot virus.

[16449] VGAM1178 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1178 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16450] An enzyme complex designated DICER COMPLEX, dices the VGAM1178 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1178 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1178 RNA is designated SEQ ID:3889, and is provided hereinbelow with reference to the sequence listing part.

[16451] VGAM1178 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1178 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1178 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16452] VGAM1178 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1178 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1178 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1178 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1178 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16453] The complementary binding of VGAM1178 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1178 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1178 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1178 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16454] It is appreciated that VGAM1178 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1178 host target genes. The mRNA of each one of this plurality of VGAM1178 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1178 RNA, herein designated VGAM RNA, and which when bound by VGAM1178 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1178 host target proteins.

[16455] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1178 gene, herein designated VGAM GENE, on one or more VGAM1178 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16456] It is yet further appreciated that a function of VGAM1178 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1178 include diagnosis, prevention and treatment of viral infection by Odontoglossum ringspot virus. Specific functions, and accordingly utilities, of VGAM1178 correlate with, and may be deduced from, the identity of the host target genes which VGAM1178 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16457] Nucleotide sequences of the VGAM1178 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1178 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1178 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1178 are further described hereinbelow with reference to Table 1.

[16458] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1178 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16459] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1179 (VGAM1179) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16460] VGAM1179 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1179 was detected is described hereinabove with reference to Figs. 2-8.

[16461] VGAM1179 gene, herein designated VGAM GENE, is a viral gene contained in the genome of *Odontoglossum ringspot*

virus. VGAM1179 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16462] VGAM1179 gene, herein designated VGAM GENE, encodes a VGAM1179 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1179 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1179 precursor RNA is designated SEQ ID:1165, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1165 is located at position 5650 relative to the genome of Odontoglossum ringspot virus.

[16463] VGAM1179 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1179 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[16464] An enzyme complex designated DICER COMPLEX, dices the VGAM1179 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1179 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM1179 RNA is designated SEQ ID:3890, and is provided hereinbelow with reference to the sequence listing part.

[16465] VGAM1179 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1179 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1179 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16466] VGAM1179 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1179 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1179 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1179 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1179 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16467] The complementary binding of VGAM1179 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1179 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1179 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1179 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16468] It is appreciated that VGAM1179 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1179 host target genes. The mRNA of each one of this plurality of VGAM1179 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1179 RNA, herein designated VGAM RNA, and which when bound by VGAM1179 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1179 host target proteins.

[16469] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1179 gene, herein designated VGAM GENE, on one or more VGAM1179 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16470] It is yet further appreciated that a function of VGAM1179 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1179 include diagnosis, prevention and treatment of viral infection by Odontoglossum ringspot virus. Specific functions, and accordingly utilities, of VGAM1179 correlate with, and may be deduced from, the identity of the host target genes which VGAM1179 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16471] Nucleotide sequences of the VGAM1179 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1179 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1179 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1179 are further described hereinbelow with reference to Table 1.

[16472] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1179 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16473] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1180 (VGAM1180) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16474] VGAM1180 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1180 was detected is described hereinabove with reference to Figs. 2-8.

[16475] VGAM1180 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Odontoglossum ringspot virus. VGAM1180 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16476] VGAM1180 gene, herein designated VGAM GENE, encodes a VGAM1180 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1180 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1180 precursor RNA is designated SEQ ID:1166, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1166 is located at position 2834 relative to the genome of Odontoglossum ringspot virus.

[16477] VGAM1180 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1180 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16478] An enzyme complex designated DICER COMPLEX, dices the VGAM1180 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1180 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1180 RNA is designated SEQ ID:3891, and is provided hereinbelow with reference to the sequence listing part.

[16479] VGAM1180 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1180 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1180 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16480] VGAM1180 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1180 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1180 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1180 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1180 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16481] The complementary binding of VGAM1180 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1180 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1180 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1180 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16482] It is appreciated that VGAM1180 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1180 host target genes. The mRNA of each one of this plurality of VGAM1180 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1180 RNA, herein designated VGAM RNA, and which when bound by VGAM1180 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1180 host target proteins.

[16483] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1180 gene, herein designated VGAM GENE, on one or more VGAM1180 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16484] It is yet further appreciated that a function of VGAM1180 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1180 include diagnosis, prevention and treatment of viral infection by Odontoglossum ringspot virus. Specific functions, and accordingly utilities, of VGAM1180 correlate with, and may be deduced from, the identity of the host target genes which VGAM1180 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16485] Nucleotide sequences of the VGAM1180 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1180 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1180 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1180 are further described hereinbelow with reference to Table 1.

[16486] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1180 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16487] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1181 (VGAM1181) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16488] VGAM1181 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1181 was detected is described hereinabove with reference to Figs. 2-8.

[16489] VGAM1181 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Odontoglossum ringspot virus. VGAM1181 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16490] VGAM1181 gene, herein designated VGAM GENE, encodes a VGAM1181 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1181 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1181 precursor RNA is designated SEQ ID:1167, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1167 is located at position 4926 relative to the genome of Odontoglossum ringspot virus.

[16491] VGAM1181 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1181 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16492] An enzyme complex designated DICER COMPLEX, dices the VGAM1181 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1181 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1181 RNA is designated SEQ ID:3892, and is provided hereinbelow with reference to the sequence listing part.

[16493] VGAM1181 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1181 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1181 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[16494] VGAM1181 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1181 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1181 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1181 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1181 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16495] The complementary binding of VGAM1181 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1181 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1181 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1181 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16496] It is appreciated that VGAM1181 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1181 host target genes. The mRNA of each one of this plurality of VGAM1181 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1181 RNA, herein designated VGAM RNA, and which when bound by VGAM1181 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1181 host target proteins.

[16497] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1181 gene, herein designated VGAM GENE, on one

or more VGAM1181 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16498] It is yet further appreciated that a function of VGAM1181 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1181 include diagnosis, prevention and treatment of viral infection by Odontoglossum ringspot virus. Specific functions, and accordingly utilities, of VGAM1181 correlate with, and may be deduced from, the identity of the host target genes which VGAM1181 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16499] Nucleotide sequences of the VGAM1181 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1181 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1181 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1181 are further described hereinbelow with reference to Table 1.

[16500] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1181 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16501] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1182 (VGAM1182) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16502] VGAM1182 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1182 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[16503] VGAM1182 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 4. VGAM1182 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16504] VGAM1182 gene, herein designated VGAM GENE, encodes a VGAM1182 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1182 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1182 precursor RNA is designated SEQ ID:1168, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1168 is located at position 110159 relative to the genome of Human herpesvirus 4.

[16505] VGAM1182 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1182 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16506] An enzyme complex designated DICER COMPLEX, dices the VGAM1182 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1182 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1182 RNA is designated SEQ ID:3893, and is provided hereinbelow with reference to the sequence listing part.

[16507] VGAM1182 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1182 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1182 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16508] VGAM1182 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1182 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1182 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1182 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1182 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3'UTR and 5'UTR regions.

[16509] The complementary binding of VGAM1182 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1182 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1182 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1182 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16510] It is appreciated that VGAM1182 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1182 host target genes. The mRNA of each one of this plurality of VGAM1182 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1182 RNA, herein designated VGAM RNA, and which when bound by VGAM1182 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1182 host target proteins.

[16511] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1182 gene, herein designated VGAM GENE, on one or more VGAM1182 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16512] It is yet further appreciated that a function of VGAM1182 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1182 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1182 correlate with, and may be deduced from, the identity of the host target genes which VGAM1182 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[16513] Nucleotide sequences of the VGAM1182 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1182 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1182 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1182 are further described hereinbelow with reference to Table 1.

[16514] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1182 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16515] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1183 (VGAM1183) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16516] VGAM1183 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1183 was detected is described hereinabove with reference to Figs. 2–8.

[16517] VGAM1183 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cactus virus X.

VGAM1183 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16518] VGAM1183 gene, herein designated VGAM GENE, encodes a VGAM1183 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1183 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1183 precursor RNA is designated SEQ ID:1169, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1169 is located at position 6096 relative to the genome of Cactus virus X.

[16519] VGAM1183 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1183 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16520] An enzyme complex designated DICER COMPLEX, dices the VGAM1183 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1183 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1183 RNA is designated SEQ ID:3894, and is provided hereinbelow with reference to the sequence listing part.

[16521] VGAM1183 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1183 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1183 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16522] VGAM1183 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1183 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1183 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1183 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1183 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16523] The complementary binding of VGAM1183 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1183 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1183 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1183 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16524] It is appreciated that VGAM1183 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1183 host target genes. The mRNA of each one of this plurality of VGAM1183 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1183 RNA, herein designated VGAM RNA, and which when bound by VGAM1183 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1183 host target proteins.

[16525] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1183 gene, herein designated VGAM GENE, on one or more VGAM1183 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16526] It is yet further appreciated that a function of VGAM1183 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1183 include diagnosis, prevention and treatment of viral infection by Cactus virus X. Specific functions, and accordingly utilities, of VGAM1183 correlate with, and may be deduced from, the identity of the host target genes which VGAM1183 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[16527] Nucleotide sequences of the VGAM1183 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1183 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1183 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1183 are further described hereinbelow with reference to Table 1.

[16528] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1183 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16529] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1184 (VGAM1184) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16530] VGAM1184 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1184 was detected is described hereinabove with reference to Figs. 2–8.

[16531] VGAM1184 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cactus virus X.

VGAM1184 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16532] VGAM1184 gene, herein designated VGAM GENE, encodes a VGAM1184 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1184 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1184 precursor RNA is designated SEQ ID:1170, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1170 is located at position 5274 relative to the genome of Cactus virus X.

[16533] VGAM1184 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1184 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16534] An enzyme complex designated DICER COMPLEX, dices the VGAM1184 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1184 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1184 RNA is designated SEQ ID:3895, and is provided hereinbelow with reference to the sequence listing part.

[16535] VGAM1184 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1184 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1184 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16536] VGAM1184 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1184 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1184 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1184 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1184 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16537] The complementary binding of VGAM1184 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1184 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1184 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1184 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16538] It is appreciated that VGAM1184 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1184 host target genes. The mRNA of each one of this plurality of VGAM1184 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1184 RNA, herein designated VGAM RNA, and which when bound by VGAM1184 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1184 host target proteins.

[16539] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1184 gene, herein designated VGAM GENE, on one or more VGAM1184 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16540] It is yet further appreciated that a function of VGAM1184 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1184 include diagnosis, prevention and treatment of viral infection by Cactus virus X. Specific functions, and accordingly utilities, of VGAM1184 correlate with, and may be deduced from, the identity of the

host target genes which VGAM1184 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16541] Nucleotide sequences of the VGAM1184 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1184 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1184 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1184 are further described hereinbelow with reference to Table 1.

[16542] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1184 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16543] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1185 (VGAM1185) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16544] VGAM1185 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1185 was detected is described hereinabove with reference to Figs. 2–8.

[16545] VGAM1185 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cactus virus X. VGAM1185 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16546] VGAM1185 gene, herein designated VGAM GENE, encodes a VGAM1185 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1185 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1185 precursor RNA is designated SEQ ID:1171, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1171 is located at position 4689 relative to the genome of Cactus virus X.

[16547] VGAM1185 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1185 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16548] An enzyme complex designated DICER COMPLEX, dices the VGAM1185 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1185 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1185 RNA is designated SEQ ID:3896, and is provided hereinbelow with reference to the sequence listing part.

[16549] VGAM1185 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1185 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1185 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16550] VGAM1185 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1185 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1185 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1185 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1185 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16551] The complementary binding of VGAM1185 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1185 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1185 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1185 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16552] It is appreciated that VGAM1185 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1185 host target genes. The mRNA of each one of this plurality of VGAM1185 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1185 RNA, herein designated VGAM RNA, and which when bound by VGAM1185 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1185 host target proteins.

[16553] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1185 gene, herein designated VGAM GENE, on one or more VGAM1185 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16554] It is yet further appreciated that a function of VGAM1185 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1185 include diagnosis, prevention and treatment of viral infection by Cactus virus X. Specific functions, and accordingly utilities, of VGAM1185 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM1185 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16555] Nucleotide sequences of the VGAM1185 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1185 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1185 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1185 are further described hereinbelow with reference to Table 1.

[16556] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1185 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16557] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1186 (VGAM1186) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[16558] VGAM1186 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1186 was detected is described hereinabove with reference to Figs. 2–8.

[16559] VGAM1186 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus C. VGAM1186 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16560] VGAM1186 gene, herein designated VGAM GENE, encodes a VGAM1186 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1186 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1186 precursor RNA is designated SEQ ID:1172, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1172 is located at position 30647 relative to the genome of Human adenovirus C.

[16561] VGAM1186 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1186 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16562] An enzyme complex designated DICER COMPLEX, dices the VGAM1186 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1186 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM1186 RNA is designated SEQ ID:3897, and is provided hereinbelow with reference to the sequence listing part.

[16563] VGAM1186 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1186 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1186 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16564] VGAM1186 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1186 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1186 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1186 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1186 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16565] The complementary binding of VGAM1186 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1186 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1186 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1186 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16566] It is appreciated that VGAM1186 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1186 host target genes. The mRNA of each one of this plurality of VGAM1186 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1186 RNA, herein designated VGAM RNA, and which when bound by VGAM1186 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1186 host target proteins.

[16567] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1186 gene, herein designated VGAM GENE, on one or more VGAM1186 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16568] It is yet further appreciated that a function of VGAM1186 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1186 include diagnosis, prevention and treatment of viral infection by Human adenovirus C. Spe-

cific functions, and accordingly utilities, of VGAM1186 correlate with, and may be deduced from, the identity of the host target genes which VGAM1186 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16569] Nucleotide sequences of the VGAM1186 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM1186 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1186 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1186 are further described hereinbelow with reference to Table 1.

[16570] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1186 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16571] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1187 (VGAM1187) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[16572] VGAM1187 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1187 was detected is described hereinabove with reference to Figs. 2–8.

[16573] VGAM1187 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus C. VGAM1187 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16574] VGAM1187 gene, herein designated VGAM GENE, encodes a VGAM1187 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1187 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1187 precursor RNA is designated SEQ ID:1173, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1173 is located at position 26479 relative to the genome of Human adenovirus C.

[16575] VGAM1187 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1187 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16576] An enzyme complex designated DICER COMPLEX, dices the VGAM1187 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1187 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1187 RNA is designated SEQ ID:3898, and is provided hereinbelow with reference to the sequence listing part.

[16577] VGAM1187 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1187 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1187 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16578] VGAM1187 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1187 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1187 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1187 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1187 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16579] The complementary binding of VGAM1187 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1187 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1187 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1187 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16580] It is appreciated that VGAM1187 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1187 host target genes. The mRNA of each one of this plurality of VGAM1187 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1187 RNA, herein designated VGAM RNA, and which when bound by VGAM1187 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1187 host target proteins.

[16581] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1187 gene, herein designated VGAM GENE, on one or more VGAM1187 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16582] It is yet further appreciated that a function of VGAM1187 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1187 include diagnosis, prevention and

treatment of viral infection by Human adenovirus C. Specific functions, and accordingly utilities, of VGAM1187 correlate with, and may be deduced from, the identity of the host target genes which VGAM1187 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16583] Nucleotide sequences of the VGAM1187 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1187 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1187 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1187 are further described hereinbelow with reference to Table 1.

[16584] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1187 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16585] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1188 (VGAM1188) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16586] VGAM1188 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1188 was detected is described hereinabove with reference to Figs. 2–8.

[16587] VGAM1188 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus C. VGAM1188 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16588] VGAM1188 gene, herein designated VGAM GENE, encodes a VGAM1188 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1188 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1188 precursor RNA is designated SEQ ID:1174, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1174 is located at position 27647 relative to the genome of Human adenovirus C.

[16589] VGAM1188 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1188 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16590] An enzyme complex designated DICER COMPLEX, dices the VGAM1188 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1188 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1188 RNA is designated SEQ ID:3899, and is provided hereinbelow with reference to the sequence listing part.

[16591] VGAM1188 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1188 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1188 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16592] VGAM1188 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1188 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1188 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1188 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1188 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16593] The complementary binding of VGAM1188 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1188 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1188 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1188 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16594] It is appreciated that VGAM1188 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1188 host target genes. The mRNA of each one of this plurality of VGAM1188 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1188 RNA, herein designated VGAM

RNA, and which when bound by VGAM1188 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1188 host target proteins.

[16595] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1188 gene, herein designated VGAM GENE, on one or more VGAM1188 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16596] It is yet further appreciated that a function of VGAM1188 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1188 include diagnosis, prevention and treatment of viral infection by Human adenovirus C. Specific functions, and accordingly utilities, of VGAM1188 correlate with, and may be deduced from, the identity of the host target genes which VGAM1188 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16597] Nucleotide sequences of the VGAM1188 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1188 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1188 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1188 are further described hereinbelow with reference to Table 1.

[16598] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1188 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16599] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1189 (VGAM1189) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16600] VGAM1189 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1189 was detected is described hereinabove with reference to Figs. 2-8.

[16601] VGAM1189 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Botrytis virus F. VGAM1189 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16602] VGAM1189 gene, herein designated VGAM GENE, encodes a VGAM1189 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1189 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1189 precursor RNA is designated SEQ ID:1175, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1175 is located at position 2597

relative to the genome of Botrytis virus F.

[16603] VGAM1189 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1189 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16604] An enzyme complex designated DICER COMPLEX, dices the VGAM1189 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1189 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1189 RNA is designated SEQ ID:3900, and is provided hereinbelow with reference to the sequence listing part.

[16605] VGAM1189 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1189 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1189 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16606] VGAM1189 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1189 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1189 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1189 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1189 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16607] The complementary binding of VGAM1189 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1189 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1189 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1189 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16608] It is appreciated that VGAM1189 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1189 host target genes. The mRNA of each one of this plurality of VGAM1189 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1189 RNA, herein designated VGAM RNA, and which when bound by VGAM1189 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1189 host target proteins.

[16609] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1189 gene, herein designated VGAM GENE, on one or more VGAM1189 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16610] It is yet further appreciated that a function of VGAM1189 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1189 include diagnosis, prevention and treatment of viral infection by Botrytis virus F. Specific functions, and accordingly utilities, of VGAM1189 correlate with, and may be deduced from, the identity of the host target genes which VGAM1189 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16611] Nucleotide sequences of the VGAM1189 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1189 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1189 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1189 are further described hereinbelow with reference to Table 1.

[16612] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1189 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16613] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1190 (VGAM1190) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16614] VGAM1190 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1190 was detected is described hereinabove with reference to Figs. 2–8.

[16615] VGAM1190 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Botrytis virus F. VGAM1190 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16616] VGAM1190 gene, herein designated VGAM GENE, encodes a VGAM1190 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1190 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1190 precursor RNA is designated SEQ ID:1176, and is provided hereinbelow with reference to the sequence listing part. Nu–

cleotide sequence SEQ ID:1176 is located at position 2147 relative to the genome of Botrytis virus F.

[16617] VGAM1190 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1190 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16618] An enzyme complex designated DICER COMPLEX, dices the VGAM1190 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1190 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 62%) nucleotide sequence of VGAM1190 RNA is designated SEQ ID:3901, and is provided hereinbelow with reference to the sequence

listing part.

[16619] VGAM1190 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1190 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1190 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16620] VGAM1190 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1190 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1190 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1190 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1190 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16621] The complementary binding of VGAM1190 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1190 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1190 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1190 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16622] It is appreciated that VGAM1190 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1190 host target genes. The mRNA of each one of this plurality of VGAM1190 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1190 RNA, herein designated VGAM RNA, and which when bound by VGAM1190 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1190 host target proteins.

[16623] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1190 gene, herein designated VGAM GENE, on one or more VGAM1190 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16624] It is yet further appreciated that a function of VGAM1190

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1190 include diagnosis, prevention and treatment of viral infection by Botrytis virus F. Specific functions, and accordingly utilities, of VGAM1190 correlate with, and may be deduced from, the identity of the host target genes which VGAM1190 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16625] Nucleotide sequences of the VGAM1190 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1190 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1190 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1190 are further described hereinbelow with reference to Table 1.

[16626] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1190 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16627] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1191 (VGAM1191) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16628] VGAM1191 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1191 was detected is described hereinabove with reference to Figs. 2–8.

[16629] VGAM1191 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Botrytis virus F. VGAM1191 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16630] VGAM1191 gene, herein designated VGAM GENE, encodes a VGAM1191 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1191 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1191 precursor RNA is designated SEQ ID:1177, and is provided here–

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1177 is located at position 5016 relative to the genome of Botrytis virus F.

[16631] VGAM1191 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1191 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16632] An enzyme complex designated DICER COMPLEX, dices the VGAM1191 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1191 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM1191 RNA is designated SEQ ID:3902, and

is provided hereinbelow with reference to the sequence listing part.

[16633] VGAM1191 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1191 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1191 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16634] VGAM1191 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1191 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1191 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1191 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1191 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16635] The complementary binding of VGAM1191 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1191 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1191 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1191 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16636] It is appreciated that VGAM1191 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1191 host target genes. The mRNA of each one of this plurality of VGAM1191 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1191 RNA, herein designated VGAM RNA, and which when bound by VGAM1191 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1191 host target proteins.

[16637] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1191 gene, herein designated VGAM GENE, on one or more VGAM1191 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16638] It is yet further appreciated that a function of VGAM1191 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1191 include diagnosis, prevention and treatment of viral infection by Botrytis virus F. Specific functions, and accordingly utilities, of VGAM1191 correlate with, and may be deduced from, the identity of the host target genes which VGAM1191 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16639] Nucleotide sequences of the VGAM1191 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1191 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1191 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1191 are further described hereinbelow with reference to Table 1.

[16640] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1191 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16641] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1192 (VGAM1192) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16642] VGAM1192 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1192 was detected is described hereinabove with reference to Figs. 2–8.

[16643] VGAM1192 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus. VGAM1192 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16644] VGAM1192 gene, herein designated VGAM GENE, encodes a VGAM1192 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1192 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1192 precu-

sor RNA is designated SEQ ID:1178, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1178 is located at position 37365 relative to the genome of Cowpox virus.

[16645] VGAM1192 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1192 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16646] An enzyme complex designated DICER COMPLEX, dices the VGAM1192 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1192 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide se-

quence of VGAM1192 RNA is designated SEQ ID:3903, and is provided hereinbelow with reference to the sequence listing part.

[16647] VGAM1192 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1192 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1192 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16648] VGAM1192 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1192 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1192 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1192 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1192 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16649] The complementary binding of VGAM1192 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1192 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1192 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1192 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16650] It is appreciated that VGAM1192 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1192 host target genes. The mRNA of

each one of this plurality of VGAM1192 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1192 RNA, herein designated VGAM RNA, and which when bound by VGAM1192 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1192 host target proteins.

[16651] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1192 gene, herein designated VGAM GENE, on one or more VGAM1192 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[16652] It is yet further appreciated that a function of VGAM1192 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1192 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM1192 correlate with, and may be deduced from, the identity of the host target genes which VGAM1192 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16653] Nucleotide sequences of the VGAM1192 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1192 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1192 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1192 are further described hereinbelow with reference to Table 1.

[16654] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1192 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[16655] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1193 (VGAM1193) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16656] VGAM1193 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1193 was detected is described hereinabove with reference to Figs. 2–8.

[16657] VGAM1193 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus. VGAM1193 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16658] VGAM1193 gene, herein designated VGAM GENE, encodes a VGAM1193 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1193 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1193 precursor RNA is designated SEQ ID:1179, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1179 is located at position 26098 relative to the genome of Vaccinia virus.

[16659] VGAM1193 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1193 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16660] An enzyme complex designated DICER COMPLEX, dices the VGAM1193 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1193 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1193 RNA is designated SEQ ID:3904, and is provided hereinbelow with reference to the sequence listing part.

[16661] VGAM1193 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1193 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1193 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16662] VGAM1193 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1193 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1193 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1193 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1193 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16663] The complementary binding of VGAM1193 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1193 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1193 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1193 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16664] It is appreciated that VGAM1193 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1193 host target genes. The mRNA of each one of this plurality of VGAM1193 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1193 RNA, herein designated VGAM RNA, and which when bound by VGAM1193 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1193 host target proteins.

[16665] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1193 gene, herein designated VGAM GENE, on one or more VGAM1193 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[16666] It is yet further appreciated that a function of VGAM1193 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1193 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM1193 correlate with, and may be deduced from, the identity of the host target genes which VGAM1193 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16667] Nucleotide sequences of the VGAM1193 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1193 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1193 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1193 are further described hereinbelow with reference to Table 1.

[16668] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1193 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16669] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1194 (VGAM1194) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16670] VGAM1194 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1194 was detected is described hereinabove with reference to Figs. 2-8.

[16671] VGAM1194 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM1194 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16672] VGAM1194 gene, herein designated VGAM GENE, encodes a VGAM1194 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1194 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1194 precursor RNA is designated SEQ ID:1180, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1180 is located at position 25686 relative to the genome of Camelpox virus.

[16673] VGAM1194 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1194 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16674] An enzyme complex designated DICER COMPLEX, dices the VGAM1194 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1194 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM1194 RNA is designated SEQ ID:3905, and is provided hereinbelow with reference to the sequence listing part.

[16675] VGAM1194 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1194 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1194 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16676] VGAM1194 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1194 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1194 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1194 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1194 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16677] The complementary binding of VGAM1194 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1194 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1194 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1194 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16678] It is appreciated that VGAM1194 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1194 host target genes. The mRNA of each one of this plurality of VGAM1194 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1194 RNA, herein designated VGAM RNA, and which when bound by VGAM1194 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1194 host target proteins.

[16679] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1194 gene, herein designated VGAM GENE, on one or more VGAM1194 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16680] It is yet further appreciated that a function of VGAM1194 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1194 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1194 correlate with, and may be deduced from, the identity of the host target genes which VGAM1194 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16681] Nucleotide sequences of the VGAM1194 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1194 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1194 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1194 are further described hereinbelow with reference to Table 1.

[16682] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1194 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16683] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1195 (VGAM1195) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16684] VGAM1195 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1195 was detected is described hereinabove with reference to Figs. 2–8.

[16685] VGAM1195 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM1195 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16686] VGAM1195 gene, herein designated VGAM GENE, encodes a VGAM1195 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1195 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1195 precursor RNA is designated SEQ ID:1181, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1181 is located at position 79725 relative to the genome of Equine herpesvirus 1.

[16687] VGAM1195 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1195 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16688] An enzyme complex designated DICER COMPLEX, dices the VGAM1195 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1195 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1195 RNA is designated SEQ ID:3906, and is provided hereinbelow with reference to the sequence listing part.

[16689] VGAM1195 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1195 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1195 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16690] VGAM1195 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1195 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1195 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1195 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1195 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16691] The complementary binding of VGAM1195 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1195 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1195 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1195 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16692] It is appreciated that VGAM1195 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1195 host target genes. The mRNA of each one of this plurality of VGAM1195 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1195 RNA, herein designated VGAM RNA, and which when bound by VGAM1195 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1195 host target proteins.

[16693] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1195 gene, herein designated VGAM GENE, on one or more VGAM1195 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16694] It is yet further appreciated that a function of VGAM1195 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1195 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1195 correlate with, and may be deduced from, the identity of the host target genes which VGAM1195 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16695] Nucleotide sequences of the VGAM1195 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1195 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1195 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1195 are further described hereinbelow with reference to Table 1.

[16696] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1195 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16697] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1196 (VGAM1196) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16698] VGAM1196 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1196 was detected is described hereinabove with reference to Figs. 2-8.

[16699] VGAM1196 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM1196 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16700] VGAM1196 gene, herein designated VGAM GENE, encodes a VGAM1196 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1196 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1196 precursor RNA is designated SEQ ID:1182, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1182 is located at position 82687 relative to the genome of Equine herpesvirus 1.

[16701] VGAM1196 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1196 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16702] An enzyme complex designated DICER COMPLEX, dices the VGAM1196 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1196 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1196 RNA is designated SEQ ID:3907, and is provided hereinbelow with reference to the sequence listing part.

[16703] VGAM1196 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1196 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1196 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16704] VGAM1196 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1196 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1196 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1196 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1196 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16705] The complementary binding of VGAM1196 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1196 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1196 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1196 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[16706] It is appreciated that VGAM1196 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1196 host target genes. The mRNA of each one of this plurality of VGAM1196 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1196 RNA, herein designated VGAM RNA, and which when bound by VGAM1196 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1196 host target proteins.

[16707] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1196 gene, herein designated VGAM GENE, on one or more VGAM1196 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16708] It is yet further appreciated that a function of VGAM1196 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1196 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1196 correlate with, and may be deduced from, the identity of the host target genes which VGAM1196 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16709] Nucleotide sequences of the VGAM1196 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM1196 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1196 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1196 are further described hereinbelow with reference to Table 1.

[16710] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1196 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16711] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1197 (VGAM1197) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16712] VGAM1197 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1197 was detected is described hereinabove with reference to Figs. 2-8.

[16713] VGAM1197 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM1197 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16714] VGAM1197 gene, herein designated VGAM GENE, encodes a VGAM1197 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1197 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1197 precursor RNA is designated SEQ ID:1183, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1183 is located at position 80050 relative to the genome of Equine herpesvirus 1.

[16715] VGAM1197 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1197 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16716] An enzyme complex designated DICER COMPLEX, dices the VGAM1197 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1197 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1197 RNA is designated SEQ ID:3908, and is provided hereinbelow with reference to the sequence listing part.

[16717] VGAM1197 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1197 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1197 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16718] VGAM1197 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1197 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1197 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1197 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1197 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16719] The complementary binding of VGAM1197 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1197 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1197 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1197 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16720] It is appreciated that VGAM1197 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1197 host target genes. The mRNA of each one of this plurality of VGAM1197 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1197 RNA, herein designated VGAM RNA, and which when bound by VGAM1197 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1197 host target proteins.

[16721] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1197 gene, herein designated VGAM GENE, on one or more VGAM1197 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16722] It is yet further appreciated that a function of VGAM1197 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1197 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1197 correlate with, and may be deduced from, the identity of the host target genes which VGAM1197 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16723] Nucleotide sequences of the VGAM1197 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1197 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1197 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1197 are further described hereinbelow with reference to Table 1.

[16724] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1197 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16725] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1198 (VGAM1198) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16726] VGAM1198 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1198 was detected is described hereinabove with reference to Figs. 2-8.

[16727] VGAM1198 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM1198 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16728] VGAM1198 gene, herein designated VGAM GENE, encodes

a VGAM1198 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1198 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1198 precursor RNA is designated SEQ ID:1184, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1184 is located at position 80155 relative to the genome of Equine herpesvirus 1.

[16729] VGAM1198 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1198 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16730] An enzyme complex designated DICER COMPLEX, dices the VGAM1198 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1198 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM1198 RNA is designated SEQ ID:3909, and is provided hereinbelow with reference to the sequence listing part.

[16731] VGAM1198 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1198 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1198 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16732] VGAM1198 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1198 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1198 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1198 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1198 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16733] The complementary binding of VGAM1198 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1198 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1198 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1198 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16734] It is appreciated that VGAM1198 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1198 host target genes. The mRNA of each one of this plurality of VGAM1198 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1198 RNA, herein designated VGAM RNA, and which when bound by VGAM1198 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1198 host target proteins.

[16735] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1198 gene, herein designated VGAM GENE, on one or more VGAM1198 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16736] It is yet further appreciated that a function of VGAM1198 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1198 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1198 correlate with, and may be deduced from, the identity of the host target genes which VGAM1198 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16737] Nucleotide sequences of the VGAM1198 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM1198 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1198 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1198 are further

described hereinbelow with reference to Table 1.

[16738] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1198 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16739] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1199 (VGAM1199) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16740] VGAM1199 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1199 was detected is described hereinabove with reference to Figs. 2-8.

[16741] VGAM1199 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian nephritis virus. VGAM1199 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16742] VGAM1199 gene, herein designated VGAM GENE, encodes a VGAM1199 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1199 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1199 precursor RNA is designated SEQ ID:1185, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1185 is located at position 6153 relative to the genome of Avian nephritis virus.

[16743] VGAM1199 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1199 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16744] An enzyme complex designated DICER COMPLEX, dices the VGAM1199 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1199 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1199 RNA is designated SEQ ID:3910, and is provided hereinbelow with reference to the sequence listing part.

[16745] VGAM1199 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1199 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1199 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16746] VGAM1199 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1199 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1199 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1199 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1199 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16747] The complementary binding of VGAM1199 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1199 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1199

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1199 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16748] It is appreciated that VGAM1199 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1199 host target genes. The mRNA of each one of this plurality of VGAM1199 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1199 RNA, herein designated VGAM RNA, and which when bound by VGAM1199 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1199 host target proteins.

[16749] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1199 gene, herein designated VGAM GENE, on one or more VGAM1199 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16750] It is yet further appreciated that a function of VGAM1199 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1199 include diagnosis, prevention and treatment of viral infection by Avian nephritis virus. Specific functions, and accordingly utilities, of VGAM1199 correlate with, and may be deduced from, the identity of the host target genes which VGAM1199 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16751] Nucleotide sequences of the VGAM1199 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1199 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1199 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1199 are further described hereinbelow with reference to Table 1.

[16752] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1199 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16753] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1200 (VGAM1200) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16754] VGAM1200 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1200 was detected is described hereinabove with reference to Figs. 2-8.

[16755] VGAM1200 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian nephritis virus. VGAM1200 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[16756] VGAM1200 gene, herein designated VGAM GENE, encodes a VGAM1200 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1200 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1200 precursor RNA is designated SEQ ID:1186, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1186 is located at position 5356 relative to the genome of Avian nephritis virus.

[16757] VGAM1200 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1200 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16758] An enzyme complex designated DICER COMPLEX, dices

the VGAM1200 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1200 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1200 RNA is designated SEQ ID:3911, and is provided hereinbelow with reference to the sequence listing part.

[16759] VGAM1200 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1200 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1200 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16760] VGAM1200 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1200 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1200 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1200 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1200 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16761] The complementary binding of VGAM1200 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1200 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1200 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1200 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16762] It is appreciated that VGAM1200 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1200 host target genes. The mRNA of each one of this plurality of VGAM1200 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1200 RNA, herein designated VGAM RNA, and which when bound by VGAM1200 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1200 host target proteins.

[16763] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1200 gene, herein designated VGAM GENE, on one or more VGAM1200 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16764] It is yet further appreciated that a function of VGAM1200 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1200 include diagnosis, prevention and treatment of viral infection by Avian nephritis virus. Specific functions, and accordingly utilities, of VGAM1200 correlate with, and may be deduced from, the identity of the host target genes which VGAM1200 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16765] Nucleotide sequences of the VGAM1200 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1200 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1200 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1200 are further described hereinbelow with reference to Table 1.

[16766] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1200 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16767] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1201 (VGAM1201) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16768] VGAM1201 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1201 was detected is described hereinabove with reference to Figs. 2-8.

[16769] VGAM1201 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian nephritis virus. VGAM1201 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[16770] VGAM1201 gene, herein designated VGAM GENE, encodes a VGAM1201 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1201 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1201 precursor RNA is designated SEQ ID:1187, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1187 is located at position 5950 relative to the genome of Avian nephritis virus.

[16771] VGAM1201 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1201 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16772] An enzyme complex designated DICER COMPLEX, dices the VGAM1201 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1201 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1201 RNA is designated SEQ ID:3912, and is provided hereinbelow with reference to the sequence listing part.

[16773] VGAM1201 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1201 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1201 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16774] VGAM1201 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1201 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1201 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1201 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1201 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16775] The complementary binding of VGAM1201 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1201 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1201 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1201 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16776] It is appreciated that VGAM1201 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1201 host target genes. The mRNA of each one of this plurality of VGAM1201 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1201 RNA, herein designated VGAM RNA, and which when bound by VGAM1201 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1201 host target proteins.

[16777] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1201 gene, herein designated VGAM GENE, on one or more VGAM1201 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16778] It is yet further appreciated that a function of VGAM1201 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1201 include diagnosis, prevention and treatment of viral infection by Avian nephritis virus. Specific functions, and accordingly utilities, of VGAM1201 correlate with, and may be deduced from, the identity of the host target genes which VGAM1201 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16779] Nucleotide sequences of the VGAM1201 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1201 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1201 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1201 are further described hereinbelow with reference to Table 1.

[16780] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1201 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16781] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1202 (VGAM1202) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16782] VGAM1202 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1202 was detected is described hereinabove with reference to Figs. 2-8.

[16783] VGAM1202 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian nephritis virus.

VGAM1202 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16784] VGAM1202 gene, herein designated VGAM GENE, encodes a VGAM1202 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1202 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1202 precursor RNA is designated SEQ ID:1188, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1188 is located at position 3947 relative to the genome of Avian nephritis virus.

[16785] VGAM1202 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1202 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[16786] An enzyme complex designated DICER COMPLEX, dices the VGAM1202 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1202 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1202 RNA is designated SEQ ID:3913, and is provided hereinbelow with reference to the sequence listing part.

[16787] VGAM1202 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1202 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1202 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16788] VGAM1202 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1202 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1202 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1202 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1202 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16789] The complementary binding of VGAM1202 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1202 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1202 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1202 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16790] It is appreciated that VGAM1202 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1202 host target genes. The mRNA of each one of this plurality of VGAM1202 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1202 RNA, herein designated VGAM RNA, and which when bound by VGAM1202 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1202 host target proteins.

[16791] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1202 gene, herein designated VGAM GENE, on one or more VGAM1202 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16792] It is yet further appreciated that a function of VGAM1202 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1202 include diagnosis, prevention and treatment of viral infection by Avian nephritis virus. Specific functions, and accordingly utilities, of VGAM1202 correlate with, and may be deduced from, the identity of the host target genes which VGAM1202 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16793] Nucleotide sequences of the VGAM1202 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1202 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1202 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1202 are further described hereinbelow with reference to Table 1.

[16794] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1202 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16795] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1203 (VGAM1203) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16796] VGAM1203 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1203 was detected is described hereinabove with reference to Figs. 2-8.

[16797] VGAM1203 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Scallion virus X.

VGAM1203 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16798] VGAM1203 gene, herein designated VGAM GENE, encodes a VGAM1203 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1203 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1203 precursor RNA is designated SEQ ID:1189, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1189 is located at position 2316 relative to the genome of Scallion virus X.

[16799] VGAM1203 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1203 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16800] An enzyme complex designated DICER COMPLEX, dices the VGAM1203 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1203 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1203 RNA is designated SEQ ID:3914, and is provided hereinbelow with reference to the sequence listing part.

[16801] VGAM1203 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1203 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1203 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16802] VGAM1203 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1203 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1203 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1203 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1203 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16803] The complementary binding of VGAM1203 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1203 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1203 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1203 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16804] It is appreciated that VGAM1203 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1203 host target genes. The mRNA of each one of this plurality of VGAM1203 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1203 RNA, herein designated VGAM RNA, and which when bound by VGAM1203 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1203 host target proteins.

[16805] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1203 gene, herein designated VGAM GENE, on one or more VGAM1203 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16806] It is yet further appreciated that a function of VGAM1203 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1203 include diagnosis, prevention and treatment of viral infection by Scallion virus X. Specific functions, and accordingly utilities, of VGAM1203 correlate with, and may be deduced from, the identity of the host target genes which VGAM1203 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16807] Nucleotide sequences of the VGAM1203 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1203 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1203 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1203 are further described hereinbelow with reference to Table 1.

[16808] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1203 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16809] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1204 (VGAM1204) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16810] VGAM1204 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1204 was detected is described hereinabove with reference to Figs. 2-8.

[16811] VGAM1204 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Scallion virus X.

VGAM1204 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16812] VGAM1204 gene, herein designated VGAM GENE, encodes a VGAM1204 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1204 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1204 precursor RNA is designated SEQ ID:1190, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1190 is located at position 3095 relative to the genome of Scallion virus X.

[16813] VGAM1204 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1204 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16814] An enzyme complex designated DICER COMPLEX, dices the VGAM1204 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1204 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1204 RNA is designated SEQ ID:3915, and is provided hereinbelow with reference to the sequence listing part.

[16815] VGAM1204 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1204 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1204 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[16816] VGAM1204 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1204 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1204 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1204 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1204 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16817] The complementary binding of VGAM1204 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1204 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1204 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1204 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16818] It is appreciated that VGAM1204 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1204 host target genes. The mRNA of each one of this plurality of VGAM1204 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1204 RNA, herein designated VGAM RNA, and which when bound by VGAM1204 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1204 host target proteins.

[16819] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1204 gene, herein designated VGAM GENE, on one

or more VGAM1204 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16820] It is yet further appreciated that a function of VGAM1204 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1204 include diagnosis, prevention and treatment of viral infection by Scallion virus X. Specific functions, and accordingly utilities, of VGAM1204 correlate with, and may be deduced from, the identity of the host target genes which VGAM1204 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16821] Nucleotide sequences of the VGAM1204 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1204 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1204 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1204 are further described hereinbelow with reference to Table 1.

[16822] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1204 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16823] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1205 (VGAM1205) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16824] VGAM1205 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1205 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[16825] VGAM1205 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Scallion virus X.

VGAM1205 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16826] VGAM1205 gene, herein designated VGAM GENE, encodes a VGAM1205 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1205 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1205 precursor RNA is designated SEQ ID:1191, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1191 is located at position 2547 relative to the genome of Scallion virus X.

[16827] VGAM1205 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1205 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16828] An enzyme complex designated DICER COMPLEX, dices the VGAM1205 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1205 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM1205 RNA is designated SEQ ID:3916, and is provided hereinbelow with reference to the sequence listing part.

[16829] VGAM1205 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1205 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1205 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16830] VGAM1205 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1205 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1205 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1205 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1205 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[16831] The complementary binding of VGAM1205 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1205 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1205 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1205 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16832] It is appreciated that VGAM1205 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1205 host target genes. The mRNA of each one of this plurality of VGAM1205 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1205 RNA, herein designated VGAM RNA, and which when bound by VGAM1205 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1205 host target proteins.

[16833] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1205 gene, herein designated VGAM GENE, on one or more VGAM1205 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16834] It is yet further appreciated that a function of VGAM1205 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1205 include diagnosis, prevention and treatment of viral infection by Scallion virus X. Specific functions, and accordingly utilities, of VGAM1205 correlate with, and may be deduced from, the identity of the host target genes which VGAM1205 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[16835] Nucleotide sequences of the VGAM1205 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1205 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1205 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1205 are further described hereinbelow with reference to Table 1.

[16836] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1205 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16837] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1206 (VGAM1206) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16838] VGAM1206 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1206 was detected is described hereinabove with reference to Figs. 2–8.

[16839] VGAM1206 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Clover yellow mosaic virus. VGAM1206 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16840] VGAM1206 gene, herein designated VGAM GENE, encodes a VGAM1206 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1206 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1206 precursor RNA is designated SEQ ID:1192, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1192 is located at position 961 relative to the genome of Clover yellow mosaic virus.

[16841] VGAM1206 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1206 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16842] An enzyme complex designated DICER COMPLEX, dices the VGAM1206 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1206 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1206 RNA is designated SEQ ID:3917, and is provided hereinbelow with reference to the sequence listing part.

[16843] VGAM1206 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1206 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1206 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16844] VGAM1206 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1206 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1206 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1206 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1206 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16845] The complementary binding of VGAM1206 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1206 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1206 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1206 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16846] It is appreciated that VGAM1206 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1206 host target genes. The mRNA of each one of this plurality of VGAM1206 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1206 RNA, herein designated VGAM RNA, and which when bound by VGAM1206 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1206 host target proteins.

[16847] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1206 gene, herein designated VGAM GENE, on one or more VGAM1206 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16848] It is yet further appreciated that a function of VGAM1206 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1206 include diagnosis, prevention and treatment of viral infection by Clover yellow mosaic virus. Specific functions, and accordingly utilities, of VGAM1206 correlate with, and may be deduced from, the identity of the host target genes which VGAM1206 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[16849] Nucleotide sequences of the VGAM1206 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1206 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1206 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1206 are further described hereinbelow with reference to Table 1.

[16850] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1206 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16851] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1207 (VGAM1207) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16852] VGAM1207 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1207 was detected is described hereinabove with reference to Figs. 2–8.

[16853] VGAM1207 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Clover yellow mosaic virus. VGAM1207 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16854] VGAM1207 gene, herein designated VGAM GENE, encodes a VGAM1207 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1207 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1207 precursor RNA is designated SEQ ID:1193, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1193 is located at position 3847 relative to the genome of Clover yellow mosaic virus.

[16855] VGAM1207 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1207 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16856] An enzyme complex designated DICER COMPLEX, dices the VGAM1207 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1207 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM1207 RNA is designated SEQ ID:3918, and is provided hereinbelow with reference to the sequence listing part.

[16857] VGAM1207 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1207 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1207 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16858] VGAM1207 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1207 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1207 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1207 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1207 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16859] The complementary binding of VGAM1207 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1207 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1207 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1207 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16860] It is appreciated that VGAM1207 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1207 host target genes. The mRNA of each one of this plurality of VGAM1207 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1207 RNA, herein designated VGAM RNA, and which when bound by VGAM1207 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1207 host target proteins.

[16861] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1207 gene, herein designated VGAM GENE, on one or more VGAM1207 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16862] It is yet further appreciated that a function of VGAM1207 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1207 include diagnosis, prevention and treatment of viral infection by Clover yellow mosaic virus. Specific functions, and accordingly utilities, of VGAM1207 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1207 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16863] Nucleotide sequences of the VGAM1207 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1207 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1207 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1207 are further described hereinbelow with reference to Table 1.

[16864] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1207 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16865] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1208 (VGAM1208) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16866] VGAM1208 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1208 was detected is described hereinabove with reference to Figs. 2-8.

[16867] VGAM1208 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Clover yellow mosaic virus. VGAM1208 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16868] VGAM1208 gene, herein designated VGAM GENE, encodes a VGAM1208 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1208 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1208 precursor RNA is designated SEQ ID:1194, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1194 is located at position 2694 relative to the genome of Clover yellow mosaic virus.

[16869] VGAM1208 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1208 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16870] An enzyme complex designated DICER COMPLEX, dices the VGAM1208 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1208 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1208 RNA is designated SEQ ID:3919, and is provided hereinbelow with reference to the sequence listing part.

[16871] VGAM1208 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1208 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1208 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16872] VGAM1208 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1208 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1208 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1208 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1208 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16873] The complementary binding of VGAM1208 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1208 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1208 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1208 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16874] It is appreciated that VGAM1208 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1208 host target genes. The mRNA of each one of this plurality of VGAM1208 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1208 RNA, herein designated VGAM RNA, and which when bound by VGAM1208 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1208 host target proteins.

[16875] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1208 gene, herein designated VGAM GENE, on one or more VGAM1208 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16876] It is yet further appreciated that a function of VGAM1208 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1208 include diagnosis, prevention and treatment of viral infection by Clover yellow mosaic virus. Specific functions, and accordingly utilities, of VGAM1208

correlate with, and may be deduced from, the identity of the host target genes which VGAM1208 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16877] Nucleotide sequences of the VGAM1208 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1208 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1208 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1208 are further described hereinbelow with reference to Table 1.

[16878] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1208 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16879] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1209 (VGAM1209) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[16880] VGAM1209 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1209 was detected is described hereinabove with reference to Figs. 2–8.

[16881] VGAM1209 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Clover yellow mosaic virus. VGAM1209 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16882] VGAM1209 gene, herein designated VGAM GENE, encodes a VGAM1209 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1209 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1209 precursor RNA is designated SEQ ID:1195, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1195 is located at position 5426 relative to the genome of Clover yellow mosaic virus.

[16883] VGAM1209 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1209 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16884] An enzyme complex designated DICER COMPLEX, dices the VGAM1209 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1209 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM1209 RNA is designated SEQ ID:3920, and is provided hereinbelow with reference to the sequence listing part.

[16885] VGAM1209 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1209 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1209 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16886] VGAM1209 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1209 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1209 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1209 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1209 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16887] The complementary binding of VGAM1209 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1209 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1209 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1209 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16888] It is appreciated that VGAM1209 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1209 host target genes. The mRNA of each one of this plurality of VGAM1209 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1209 RNA, herein designated VGAM RNA, and which when bound by VGAM1209 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1209 host target proteins.

[16889] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1209 gene, herein designated VGAM GENE, on one or more VGAM1209 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16890] It is yet further appreciated that a function of VGAM1209 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1209 include diagnosis, prevention and treatment of viral infection by Clover yellow mosaic virus.

Specific functions, and accordingly utilities, of VGAM1209 correlate with, and may be deduced from, the identity of the host target genes which VGAM1209 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16891] Nucleotide sequences of the VGAM1209 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1209 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1209 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1209 are further described hereinbelow with reference to Table 1.

[16892] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1209 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16893] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1210 (VGAM1210) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[16894] VGAM1210 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1210 was detected is described hereinabove with reference to Figs. 2–8.

[16895] VGAM1210 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM1210 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16896] VGAM1210 gene, herein designated VGAM GENE, encodes a VGAM1210 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1210 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1210 precursor RNA is designated SEQ ID:1196, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1196 is located at position 134784 relative to the genome of Camelpox virus.

[16897] VGAM1210 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1210 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16898] An enzyme complex designated DICER COMPLEX, dices the VGAM1210 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1210 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM1210 RNA is designated SEQ ID:3921, and is provided hereinbelow with reference to the sequence listing part.

[16899] VGAM1210 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1210 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1210 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16900] VGAM1210 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1210 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1210 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1210 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1210 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16901] The complementary binding of VGAM1210 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1210 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1210 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1210 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16902] It is appreciated that VGAM1210 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1210 host target genes. The mRNA of each one of this plurality of VGAM1210 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1210 RNA, herein designated VGAM RNA, and which when bound by VGAM1210 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1210 host target proteins.

[16903] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1210 gene, herein designated VGAM GENE, on one or more VGAM1210 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16904] It is yet further appreciated that a function of VGAM1210 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1210 include diagnosis, prevention and

treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1210 correlate with, and may be deduced from, the identity of the host target genes which VGAM1210 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16905] Nucleotide sequences of the VGAM1210 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1210 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1210 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1210 are further described hereinbelow with reference to Table 1.

[16906] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1210 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16907] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1211 (VGAM1211) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16908] VGAM1211 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1211 was detected is described hereinabove with reference to Figs. 2–8.

[16909] VGAM1211 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM1211 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16910] VGAM1211 gene, herein designated VGAM GENE, encodes a VGAM1211 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1211 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1211 precursor RNA is designated SEQ ID:1197, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1197 is located at position 138029 relative to the genome of Camelpox virus.

[16911] VGAM1211 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1211 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16912] An enzyme complex designated DICER COMPLEX, dices the VGAM1211 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1211 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM1211 RNA is designated SEQ ID:3922, and is provided hereinbelow with reference to the sequence listing part.

[16913] VGAM1211 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1211 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1211 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16914] VGAM1211 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1211 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1211 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1211 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1211 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16915] The complementary binding of VGAM1211 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1211 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1211 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1211 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16916] It is appreciated that VGAM1211 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1211 host target genes. The mRNA of each one of this plurality of VGAM1211 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1211 RNA, herein designated VGAM

RNA, and which when bound by VGAM1211 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1211 host target proteins.

[16917] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1211 gene, herein designated VGAM GENE, on one or more VGAM1211 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16918] It is yet further appreciated that a function of VGAM1211 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1211 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1211 correlate with, and may be deduced from, the identity of the host target genes which VGAM1211 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16919] Nucleotide sequences of the VGAM1211 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1211 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1211 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1211 are further described hereinbelow with reference to Table 1.

[16920] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1211 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16921] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1212 (VGAM1212) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16922] VGAM1212 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1212 was detected is described hereinabove with reference to Figs. 2-8.

[16923] VGAM1212 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM1212 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16924] VGAM1212 gene, herein designated VGAM GENE, encodes a VGAM1212 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1212 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1212 precursor RNA is designated SEQ ID:1198, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1198 is located at position

133579 relative to the genome of Camelpox virus.

[16925] VGAM1212 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1212 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16926] An enzyme complex designated DICER COMPLEX, dices the VGAM1212 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1212 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1212 RNA is designated SEQ ID:3923, and is provided hereinbelow with reference to the sequence listing part.

[16927] VGAM1212 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1212 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1212 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16928] VGAM1212 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1212 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1212 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1212 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1212 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16929] The complementary binding of VGAM1212 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1212 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1212 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1212 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16930] It is appreciated that VGAM1212 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1212 host target genes. The mRNA of each one of this plurality of VGAM1212 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1212 RNA, herein designated VGAM RNA, and which when bound by VGAM1212 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1212 host target proteins.

[16931] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1212 gene, herein designated VGAM GENE, on one or more VGAM1212 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16932] It is yet further appreciated that a function of VGAM1212 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1212 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1212 correlate with, and may be deduced from, the identity of the host target genes which VGAM1212 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16933] Nucleotide sequences of the VGAM1212 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM1212 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1212 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1212 are further described hereinbelow with reference to Table 1.

[16934] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1212 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16935] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1213 (VGAM1213) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16936] VGAM1213 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1213 was detected is described hereinabove with reference to Figs. 2–8.

[16937] VGAM1213 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Strawberry mottle virus. VGAM1213 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16938] VGAM1213 gene, herein designated VGAM GENE, encodes a VGAM1213 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1213 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1213 precursor RNA is designated SEQ ID:1199, and is provided hereinbelow with reference to the sequence listing part. Nu–

cleotide sequence SEQ ID:1199 is located at position 4590 relative to the genome of Strawberry mottle virus.

[16939] VGAM1213 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1213 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16940] An enzyme complex designated DICER COMPLEX, dices the VGAM1213 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1213 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1213 RNA is designated SEQ ID:3924, and is provided hereinbelow with reference to the sequence

listing part.

[16941] VGAM1213 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1213 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1213 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16942] VGAM1213 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1213 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1213 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1213 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1213 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16943] The complementary binding of VGAM1213 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1213 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1213 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1213 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16944] It is appreciated that VGAM1213 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1213 host target genes. The mRNA of each one of this plurality of VGAM1213 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1213 RNA, herein designated VGAM RNA, and which when bound by VGAM1213 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1213 host target proteins.

[16945] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1213 gene, herein designated VGAM GENE, on one or more VGAM1213 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16946] It is yet further appreciated that a function of VGAM1213

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1213 include diagnosis, prevention and treatment of viral infection by Strawberry mottle virus. Specific functions, and accordingly utilities, of VGAM1213 correlate with, and may be deduced from, the identity of the host target genes which VGAM1213 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16947] Nucleotide sequences of the VGAM1213 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1213 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1213 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1213 are further described hereinbelow with reference to Table 1.

[16948] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1213 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16949] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1214 (VGAM1214) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16950] VGAM1214 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1214 was detected is described hereinabove with reference to Figs. 2–8.

[16951] VGAM1214 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM1214 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16952] VGAM1214 gene, herein designated VGAM GENE, encodes a VGAM1214 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1214 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1214 precursor RNA is designated SEQ ID:1200, and is provided here–

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1200 is located at position 190571 relative to the genome of Tupaia herpesvirus.

[16953] VGAM1214 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1214 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16954] An enzyme complex designated DICER COMPLEX, dices the VGAM1214 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1214 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM1214 RNA is designated SEQ ID:3925, and

is provided hereinbelow with reference to the sequence listing part.

[16955] VGAM1214 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1214 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1214 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16956] VGAM1214 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1214 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1214 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1214 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1214 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16957] The complementary binding of VGAM1214 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1214 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1214 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1214 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16958] It is appreciated that VGAM1214 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1214 host target genes. The mRNA of each one of this plurality of VGAM1214 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1214 RNA, herein designated VGAM RNA, and which when bound by VGAM1214 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1214 host target proteins.

[16959] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1214 gene, herein designated VGAM GENE, on one or more VGAM1214 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[16960] It is yet further appreciated that a function of VGAM1214 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1214 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM1214 correlate with, and may be deduced from, the identity of the host target genes which VGAM1214 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16961] Nucleotide sequences of the VGAM1214 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM1214 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1214 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1214 are further described hereinbelow with reference to Table 1.

[16962] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1214 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16963]

[16964] Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1215 (VGAM1215) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16965] VGAM1215 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1215 was detected is described hereinabove with reference to Figs. 2–8.

[16966] VGAM1215 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM1215 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16967] VGAM1215 gene, herein designated VGAM GENE, encodes a VGAM1215 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1215 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1215 precu-

sor RNA is designated SEQ ID:1201, and is provided herein below with reference to the sequence listing part. Nucleotide sequence SEQ ID:1201 is located at position 188394 relative to the genome of Tupaia herpesvirus.

[16968] VGAM1215 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1215 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16969] An enzyme complex designated DICER COMPLEX, dices the VGAM1215 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1215 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 68%) nucleotide se-

quence of VGAM1215 RNA is designated SEQ ID:3926, and is provided hereinbelow with reference to the sequence listing part.

[16970] VGAM1215 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1215 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1215 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16971] VGAM1215 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1215 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1215 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1215 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1215 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16972] The complementary binding of VGAM1215 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1215 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1215 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1215 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16973] It is appreciated that VGAM1215 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1215 host target genes. The mRNA of

each one of this plurality of VGAM1215 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1215 RNA, herein designated VGAM RNA, and which when bound by VGAM1215 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1215 host target proteins.

[16974] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1215 gene, herein designated VGAM GENE, on one or more VGAM1215 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[16975] It is yet further appreciated that a function of VGAM1215 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1215 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM1215 correlate with, and may be deduced from, the identity of the host target genes which VGAM1215 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16976] Nucleotide sequences of the VGAM1215 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1215 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1215 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1215 are further described hereinbelow with reference to Table 1.

[16977] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1215 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[16978] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1216 (VGAM1216) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16979] VGAM1216 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1216 was detected is described hereinabove with reference to Figs. 2–8.

[16980] VGAM1216 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM1216 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16981] VGAM1216 gene, herein designated VGAM GENE, encodes a VGAM1216 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1216 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1216 precursor RNA is designated SEQ ID:1202, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1202 is located at position 190154 relative to the genome of Tupaia herpesvirus.

[16982] VGAM1216 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1216 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16983] An enzyme complex designated DICER COMPLEX, dices the VGAM1216 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1216 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 76%) nucleotide sequence of VGAM1216 RNA is designated SEQ ID:3927, and is provided hereinbelow with reference to the sequence listing part.

[16984] VGAM1216 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1216 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1216 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16985] VGAM1216 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1216 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1216 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1216 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1216 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[16986] The complementary binding of VGAM1216 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1216 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1216 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1216 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16987] It is appreciated that VGAM1216 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1216 host target genes. The mRNA of each one of this plurality of VGAM1216 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1216 RNA, herein designated VGAM RNA, and which when bound by VGAM1216 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1216 host target proteins.

[16988] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1216 gene, herein designated VGAM GENE, on one or more VGAM1216 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[16989] It is yet further appreciated that a function of VGAM1216 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1216 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM1216 correlate with, and may be deduced from, the identity of the host target genes which VGAM1216 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16990] Nucleotide sequences of the VGAM1216 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1216 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1216 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1216 are further described hereinbelow with reference to Table 1.

[16991] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1216 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16992] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1217 (VGAM1217) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16993] VGAM1217 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1217 was detected is described hereinabove with reference to Figs. 2-8.

[16994] VGAM1217 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM1217 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16995] VGAM1217 gene, herein designated VGAM GENE, encodes a VGAM1217 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1217 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1217 precursor RNA is designated SEQ ID:1203, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1203 is located at position 190840 relative to the genome of Tupaia herpesvirus.

[16996] VGAM1217 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1217 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16997] An enzyme complex designated DICER COMPLEX, dices the VGAM1217 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1217 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1217 RNA is designated SEQ ID:3928, and is provided hereinbelow with reference to the sequence listing part.

[16998] VGAM1217 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1217 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1217 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[16999] VGAM1217 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1217 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1217 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1217 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1217 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17000] The complementary binding of VGAM1217 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1217 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1217 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1217 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17001] It is appreciated that VGAM1217 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1217 host target genes. The mRNA of each one of this plurality of VGAM1217 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1217 RNA, herein designated VGAM RNA, and which when bound by VGAM1217 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1217 host target proteins.

[17002] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1217 gene, herein designated VGAM GENE, on one or more VGAM1217 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17003] It is yet further appreciated that a function of VGAM1217 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1217 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM1217 correlate with, and may be deduced from, the identity of the host target genes which VGAM1217 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17004] Nucleotide sequences of the VGAM1217 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1217 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1217 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1217 are further described hereinbelow with reference to Table 1.

[17005] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1217 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17006] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1218 (VGAM1218) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17007] VGAM1218 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1218 was detected is described hereinabove with reference to Figs. 2–8.

[17008] VGAM1218 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM1218 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17009] VGAM1218 gene, herein designated VGAM GENE, encodes a VGAM1218 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1218 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1218 precursor RNA is designated SEQ ID:1204, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1204 is located at position 161690 relative to the genome of Fowlpox virus.

[17010] VGAM1218 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1218 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17011] An enzyme complex designated DICER COMPLEX, dices the VGAM1218 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1218 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM1218 RNA is designated SEQ ID:3929, and is provided hereinbelow with reference to the sequence listing part.

[17012] VGAM1218 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1218 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1218 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17013] VGAM1218 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1218 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1218 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1218 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1218 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17014] The complementary binding of VGAM1218 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1218 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1218 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1218 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17015] It is appreciated that VGAM1218 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1218 host target genes. The mRNA of each one of this plurality of VGAM1218 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1218 RNA, herein designated VGAM RNA, and which when bound by VGAM1218 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1218 host target proteins.

[17016] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1218 gene, herein designated VGAM GENE, on one or more VGAM1218 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17017] It is yet further appreciated that a function of VGAM1218 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1218 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM1218 correlate with, and may be deduced from, the identity of the host target genes which VGAM1218 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17018] Nucleotide sequences of the VGAM1218 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1218 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1218 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1218 are further described hereinbelow with reference to Table 1.

[17019] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1218 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17020] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1219 (VGAM1219) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17021] VGAM1219 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1219 was detected is described hereinabove with reference to Figs. 2-8.

[17022] VGAM1219 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM1219 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17023] VGAM1219 gene, herein designated VGAM GENE, encodes a VGAM1219 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1219 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1219 precursor RNA is designated SEQ ID:1205, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1205 is located at position 157189 relative to the genome of Fowlpox virus.

[17024] VGAM1219 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1219 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17025] An enzyme complex designated DICER COMPLEX, dices the VGAM1219 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1219 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1219 RNA is designated SEQ ID:3930, and is provided hereinbelow with reference to the sequence listing part.

[17026] VGAM1219 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1219 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1219 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17027] VGAM1219 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1219 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1219 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1219 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1219 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17028] The complementary binding of VGAM1219 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1219 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1219 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1219 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[17029] It is appreciated that VGAM1219 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1219 host target genes. The mRNA of each one of this plurality of VGAM1219 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1219 RNA, herein designated VGAM RNA, and which when bound by VGAM1219 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1219 host target proteins.

[17030] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1219 gene, herein designated VGAM GENE, on one or more VGAM1219 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17031] It is yet further appreciated that a function of VGAM1219 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1219 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM1219 correlate with, and may be deduced from, the identity of the host target genes which VGAM1219 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17032] Nucleotide sequences of the VGAM1219 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1219 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1219 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1219 are further described hereinbelow with reference to Table 1.

[17033] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1219 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17034] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1220 (VGAM1220) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17035] VGAM1220 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1220 was detected is described hereinabove with reference to Figs. 2-8.

[17036] VGAM1220 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowl adenovirus D. VGAM1220 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17037] VGAM1220 gene, herein designated VGAM GENE, encodes a VGAM1220 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1220 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1220 precursor RNA is designated SEQ ID:1206, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1206 is located at position 28289 relative to the genome of Fowl adenovirus D.

[17038] VGAM1220 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1220 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17039] An enzyme complex designated DICER COMPLEX, dices the VGAM1220 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1220 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of VGAM1220 RNA is designated SEQ ID:3931, and is provided hereinbelow with reference to the sequence listing part.

[17040] VGAM1220 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1220 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1220 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17041] VGAM1220 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1220 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1220 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1220 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1220 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17042] The complementary binding of VGAM1220 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1220 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1220 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1220 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17043] It is appreciated that VGAM1220 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1220 host target genes. The mRNA of each one of this plurality of VGAM1220 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1220 RNA, herein designated VGAM RNA, and which when bound by VGAM1220 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1220 host target proteins.

[17044] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1220 gene, herein designated VGAM GENE, on one or more VGAM1220 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17045] It is yet further appreciated that a function of VGAM1220 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1220 include diagnosis, prevention and treatment of viral infection by Fowl adenovirus D. Specific functions, and accordingly utilities, of VGAM1220 correlate with, and may be deduced from, the identity of the host target genes which VGAM1220 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17046] Nucleotide sequences of the VGAM1220 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1220 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1220 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1220 are further described hereinbelow with reference to Table 1.

[17047] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1220 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17048] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1221 (VGAM1221) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17049] VGAM1221 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1221 was detected is described hereinabove with reference to Figs. 2-8.

[17050] VGAM1221 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowl adenovirus D. VGAM1221 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17051] VGAM1221 gene, herein designated VGAM GENE, encodes

a VGAM1221 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1221 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1221 precursor RNA is designated SEQ ID:1207, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1207 is located at position 26938 relative to the genome of Fowl adenovirus D.

[17052] VGAM1221 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1221 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17053] An enzyme complex designated DICER COMPLEX, dices the VGAM1221 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1221 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1221 RNA is designated SEQ ID:3932, and is provided hereinbelow with reference to the sequence listing part.

[17054] VGAM1221 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1221 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1221 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17055] VGAM1221 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1221 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1221 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1221 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1221 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17056] The complementary binding of VGAM1221 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1221 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1221 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1221 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17057] It is appreciated that VGAM1221 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1221 host target genes. The mRNA of each one of this plurality of VGAM1221 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1221 RNA, herein designated VGAM RNA, and which when bound by VGAM1221 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1221 host target proteins.

[17058] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1221 gene, herein designated VGAM GENE, on one or more VGAM1221 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17059] It is yet further appreciated that a function of VGAM1221 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1221 include diagnosis, prevention and treatment of viral infection by Fowl adenovirus D. Specific functions, and accordingly utilities, of VGAM1221 correlate with, and may be deduced from, the identity of the host target genes which VGAM1221 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17060] Nucleotide sequences of the VGAM1221 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM1221 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1221 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1221 are further

described hereinbelow with reference to Table 1.

[17061] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1221 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17062] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1222 (VGAM1222) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17063] VGAM1222 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1222 was detected is described hereinabove with reference to Figs. 2-8.

[17064] VGAM1222 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowl adenovirus D. VGAM1222 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17065] VGAM1222 gene, herein designated VGAM GENE, encodes a VGAM1222 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1222 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1222 precursor RNA is designated SEQ ID:1208, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1208 is located at position 25411 relative to the genome of Fowl adenovirus D.

[17066] VGAM1222 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1222 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17067] An enzyme complex designated DICER COMPLEX, dices the VGAM1222 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1222 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1222 RNA is designated SEQ ID:3933, and is provided hereinbelow with reference to the sequence listing part.

[17068] VGAM1222 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1222 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1222 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17069] VGAM1222 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1222 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1222 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1222 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1222 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17070] The complementary binding of VGAM1222 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1222 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1222

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1222 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17071] It is appreciated that VGAM1222 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1222 host target genes. The mRNA of each one of this plurality of VGAM1222 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1222 RNA, herein designated VGAM RNA, and which when bound by VGAM1222 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1222 host target proteins.

[17072] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1222 gene, herein designated VGAM GENE, on one or more VGAM1222 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17073] It is yet further appreciated that a function of VGAM1222 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1222 include diagnosis, prevention and treatment of viral infection by Fowl adenovirus D. Specific functions, and accordingly utilities, of VGAM1222 correlate with, and may be deduced from, the identity of the host target genes which VGAM1222 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17074] Nucleotide sequences of the VGAM1222 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1222 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1222 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1222 are further described hereinbelow with reference to Table 1.

[17075] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1222 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17076] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1223 (VGAM1223) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17077] VGAM1223 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1223 was detected is described hereinabove with reference to Figs. 2-8.

[17078] VGAM1223 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM1223 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[17079] VGAM1223 gene, herein designated VGAM GENE, encodes a VGAM1223 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1223 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1223 precursor RNA is designated SEQ ID:1209, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1209 is located at position 143093 relative to the genome of Equine herpesvirus 2.

[17080] VGAM1223 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1223 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17081] An enzyme complex designated DICER COMPLEX, dices

the VGAM1223 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1223 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1223 RNA is designated SEQ ID:3934, and is provided hereinbelow with reference to the sequence listing part.

[17082] VGAM1223 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1223 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1223 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17083] VGAM1223 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1223 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1223 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1223 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1223 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17084] The complementary binding of VGAM1223 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1223 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1223 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1223 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17085] It is appreciated that VGAM1223 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1223 host target genes. The mRNA of each one of this plurality of VGAM1223 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1223 RNA, herein designated VGAM RNA, and which when bound by VGAM1223 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1223 host target proteins.

[17086] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1223 gene, herein designated VGAM GENE, on one or more VGAM1223 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17087] It is yet further appreciated that a function of VGAM1223 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1223 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1223 correlate with, and may be deduced from, the identity of the host target genes which VGAM1223 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17088] Nucleotide sequences of the VGAM1223 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1223 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1223 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1223 are further described hereinbelow with reference to Table 1.

[17089] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1223 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17090] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1224 (VGAM1224) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17091] VGAM1224 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1224 was detected is described hereinabove with reference to Figs. 2-8.

[17092] VGAM1224 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM1224 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[17093] VGAM1224 gene, herein designated VGAM GENE, encodes a VGAM1224 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1224 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1224 precursor RNA is designated SEQ ID:1210, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1210 is located at position 141418 relative to the genome of Equine herpesvirus 2.

[17094] VGAM1224 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1224 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17095] An enzyme complex designated DICER COMPLEX, dices the VGAM1224 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1224 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM1224 RNA is designated SEQ ID:3935, and is provided hereinbelow with reference to the sequence listing part.

[17096] VGAM1224 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1224 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1224 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17097] VGAM1224 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1224 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1224 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1224 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1224 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17098] The complementary binding of VGAM1224 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1224 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1224 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1224 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17099] It is appreciated that VGAM1224 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1224 host target genes. The mRNA of each one of this plurality of VGAM1224 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1224 RNA, herein designated VGAM RNA, and which when bound by VGAM1224 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1224 host target proteins.

[17100] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1224 gene, herein designated VGAM GENE, on one or more VGAM1224 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17101] It is yet further appreciated that a function of VGAM1224 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1224 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1224 correlate with, and may be deduced from, the identity of the host target genes which VGAM1224 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17102] Nucleotide sequences of the VGAM1224 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1224 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1224 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1224 are further described hereinbelow with reference to Table 1.

[17103] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1224 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17104] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1225 (VGAM1225) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17105] VGAM1225 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1225 was detected is described hereinabove with reference to Figs. 2-8.

[17106] VGAM1225 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 1.

VGAM1225 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17107] VGAM1225 gene, herein designated VGAM GENE, encodes a VGAM1225 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1225 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1225 precursor RNA is designated SEQ ID:1211, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1211 is located at position 88490 relative to the genome of Human herpesvirus 1.

[17108] VGAM1225 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1225 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[17109] An enzyme complex designated DICER COMPLEX, dices the VGAM1225 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1225 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1225 RNA is designated SEQ ID:3936, and is provided hereinbelow with reference to the sequence listing part.

[17110] VGAM1225 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1225 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1225 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17111] VGAM1225 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1225 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1225 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1225 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1225 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17112] The complementary binding of VGAM1225 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1225 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1225 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1225 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17113] It is appreciated that VGAM1225 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1225 host target genes. The mRNA of each one of this plurality of VGAM1225 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1225 RNA, herein designated VGAM RNA, and which when bound by VGAM1225 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1225 host target proteins.

[17114] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1225 gene, herein designated VGAM GENE, on one or more VGAM1225 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17115] It is yet further appreciated that a function of VGAM1225 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1225 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1225 correlate with, and may be deduced from, the identity of the host target genes which VGAM1225 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17116] Nucleotide sequences of the VGAM1225 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1225 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1225 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1225 are further described hereinbelow with reference to Table 1.

[17117] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1225 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17118] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1226 (VGAM1226) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17119] VGAM1226 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1226 was detected is described hereinabove with reference to Figs. 2-8.

[17120] VGAM1226 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Tacaribe virus.

VGAM1226 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17121] VGAM1226 gene, herein designated VGAM GENE, encodes a VGAM1226 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1226 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1226 precursor RNA is designated SEQ ID:1212, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1212 is located at position 6654 relative to the genome of Tacaribe virus.

[17122] VGAM1226 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1226 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17123] An enzyme complex designated DICER COMPLEX, dices the VGAM1226 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1226 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 64%) nucleotide sequence of VGAM1226 RNA is designated SEQ ID:3937, and is provided hereinbelow with reference to the sequence listing part.

[17124] VGAM1226 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1226 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1226 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17125] VGAM1226 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1226 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1226 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1226 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1226 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17126] The complementary binding of VGAM1226 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1226 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1226 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1226 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17127] It is appreciated that VGAM1226 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1226 host target genes. The mRNA of each one of this plurality of VGAM1226 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1226 RNA, herein designated VGAM RNA, and which when bound by VGAM1226 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1226 host target proteins.

[17128] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1226 gene, herein designated VGAM GENE, on one or more VGAM1226 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17129] It is yet further appreciated that a function of VGAM1226 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1226 include diagnosis, prevention and treatment of viral infection by Tacaribe virus. Specific functions, and accordingly utilities, of VGAM1226 correlate with, and may be deduced from, the identity of the host target genes which VGAM1226 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17130] Nucleotide sequences of the VGAM1226 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1226 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1226 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1226 are further described hereinbelow with reference to Table 1.

[17131] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1226 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17132] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1227 (VGAM1227) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17133] VGAM1227 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1227 was detected is described hereinabove with reference to Figs. 2-8.

[17134] VGAM1227 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tacaribe virus.

VGAM1227 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17135] VGAM1227 gene, herein designated VGAM GENE, encodes a VGAM1227 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1227 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1227 precursor RNA is designated SEQ ID:1213, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1213 is located at position 1706 relative to the genome of Tacaribe virus.

[17136] VGAM1227 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1227 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17137] An enzyme complex designated DICER COMPLEX, dices the VGAM1227 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1227 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1227 RNA is designated SEQ ID:3938, and is provided hereinbelow with reference to the sequence listing part.

[17138] VGAM1227 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1227 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1227 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[17139] VGAM1227 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1227 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1227 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1227 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1227 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17140] The complementary binding of VGAM1227 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1227 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1227 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1227 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17141] It is appreciated that VGAM1227 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1227 host target genes. The mRNA of each one of this plurality of VGAM1227 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1227 RNA, herein designated VGAM RNA, and which when bound by VGAM1227 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1227 host target proteins.

[17142] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1227 gene, herein designated VGAM GENE, on one

or more VGAM1227 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17143] It is yet further appreciated that a function of VGAM1227 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1227 include diagnosis, prevention and treatment of viral infection by Tacaribe virus. Specific functions, and accordingly utilities, of VGAM1227 correlate with, and may be deduced from, the identity of the host target genes which VGAM1227 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17144] Nucleotide sequences of the VGAM1227 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1227 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1227 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1227 are further described hereinbelow with reference to Table 1.

[17145] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1227 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17146] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1228 (VGAM1228) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17147] VGAM1228 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1228 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[17148] VGAM1228 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tacaribe virus.

VGAM1228 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17149] VGAM1228 gene, herein designated VGAM GENE, encodes a VGAM1228 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1228 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1228 precursor RNA is designated SEQ ID:1214, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1214 is located at position 2505 relative to the genome of Tacaribe virus.

[17150] VGAM1228 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1228 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17151] An enzyme complex designated DICER COMPLEX, dices the VGAM1228 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1228 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1228 RNA is designated SEQ ID:3939, and is provided hereinbelow with reference to the sequence listing part.

[17152] VGAM1228 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1228 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1228 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17153] VGAM1228 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1228 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1228 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1228 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1228 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[17154] The complementary binding of VGAM1228 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1228 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1228 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1228 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17155] It is appreciated that VGAM1228 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1228 host target genes. The mRNA of each one of this plurality of VGAM1228 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1228 RNA, herein designated VGAM RNA, and which when bound by VGAM1228 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1228 host target proteins.

[17156] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1228 gene, herein designated VGAM GENE, on one or more VGAM1228 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17157] It is yet further appreciated that a function of VGAM1228 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1228 include diagnosis, prevention and treatment of viral infection by Tacaribe virus. Specific functions, and accordingly utilities, of VGAM1228 correlate with, and may be deduced from, the identity of the host target genes which VGAM1228 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[17158] Nucleotide sequences of the VGAM1228 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1228 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1228 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1228 are further described hereinbelow with reference to Table 1.

[17159] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1228 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17160] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1229 (VGAM1229) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17161] VGAM1229 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1229 was detected is described hereinabove with reference to Figs. 2–8.

[17162] VGAM1229 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tacaribe virus.

VGAM1229 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17163] VGAM1229 gene, herein designated VGAM GENE, encodes a VGAM1229 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1229 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1229 precursor RNA is designated SEQ ID:1215, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1215 is located at position 2314 relative to the genome of Tacaribe virus.

[17164] VGAM1229 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1229 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17165] An enzyme complex designated DICER COMPLEX, dices the VGAM1229 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1229 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM1229 RNA is designated SEQ ID:3940, and is provided hereinbelow with reference to the sequence listing part.

[17166] VGAM1229 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1229 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1229 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17167] VGAM1229 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1229 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1229 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1229 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1229 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17168] The complementary binding of VGAM1229 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1229 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1229 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1229 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17169] It is appreciated that VGAM1229 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1229 host target genes. The mRNA of each one of this plurality of VGAM1229 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1229 RNA, herein designated VGAM RNA, and which when bound by VGAM1229 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1229 host target proteins.

[17170] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1229 gene, herein designated VGAM GENE, on one or more VGAM1229 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17171] It is yet further appreciated that a function of VGAM1229 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1229 include diagnosis, prevention and treatment of viral infection by Tacaribe virus. Specific functions, and accordingly utilities, of VGAM1229 correlate with, and may be deduced from, the identity of the host target genes which VGAM1229 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[17172] Nucleotide sequences of the VGAM1229 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1229 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1229 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1229 are further described hereinbelow with reference to Table 1.

[17173] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1229 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17174] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1230 (VGAM1230) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17175] VGAM1230 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1230 was detected is described hereinabove with reference to Figs. 2–8.

[17176] VGAM1230 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM1230 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17177] VGAM1230 gene, herein designated VGAM GENE, encodes a VGAM1230 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1230 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1230 precursor RNA is designated SEQ ID:1216, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1216 is located at position 12219 relative to the genome of Equine herpesvirus 2.

[17178] VGAM1230 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1230 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17179] An enzyme complex designated DICER COMPLEX, dices the VGAM1230 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1230 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1230 RNA is designated SEQ ID:3941, and is provided hereinbelow with reference to the sequence listing part.

[17180] VGAM1230 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1230 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1230 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17181] VGAM1230 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1230 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1230 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1230 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1230 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17182] The complementary binding of VGAM1230 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1230 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1230 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1230 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17183] It is appreciated that VGAM1230 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1230 host target genes. The mRNA of each one of this plurality of VGAM1230 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1230 RNA, herein designated VGAM RNA, and which when bound by VGAM1230 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1230 host target proteins.

[17184] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1230 gene, herein designated VGAM GENE, on one or more VGAM1230 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17185] It is yet further appreciated that a function of VGAM1230 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1230 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1230 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1230 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17186] Nucleotide sequences of the VGAM1230 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1230 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1230 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1230 are further described hereinbelow with reference to Table 1.

[17187] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1230 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17188] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1231 (VGAM1231) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17189] VGAM1231 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1231 was detected is described hereinabove with reference to Figs. 2-8.

[17190] VGAM1231 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM1231 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17191] VGAM1231 gene, herein designated VGAM GENE, encodes a VGAM1231 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1231 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1231 precursor RNA is designated SEQ ID:1217, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1217 is located at position 10445 relative to the genome of Equine herpesvirus 2.

[17192] VGAM1231 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1231 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17193] An enzyme complex designated DICER COMPLEX, dices the VGAM1231 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1231 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1231 RNA is designated SEQ ID:3942, and is provided hereinbelow with reference to the sequence listing part.

[17194] VGAM1231 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1231 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1231 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17195] VGAM1231 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1231 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1231 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1231 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1231 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17196] The complementary binding of VGAM1231 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1231 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1231 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1231 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17197] It is appreciated that VGAM1231 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1231 host target genes. The mRNA of each one of this plurality of VGAM1231 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1231 RNA, herein designated VGAM RNA, and which when bound by VGAM1231 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1231 host target proteins.

[17198] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1231 gene, herein designated VGAM GENE, on one or more VGAM1231 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17199] It is yet further appreciated that a function of VGAM1231 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1231 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1231

correlate with, and may be deduced from, the identity of the host target genes which VGAM1231 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17200] Nucleotide sequences of the VGAM1231 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1231 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1231 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1231 are further described hereinbelow with reference to Table 1.

[17201] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1231 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17202] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1232 (VGAM1232) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[17203] VGAM1232 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1232 was detected is described hereinabove with reference to Figs. 2–8.

[17204] VGAM1232 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM1232 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17205] VGAM1232 gene, herein designated VGAM GENE, encodes a VGAM1232 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1232 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1232 precursor RNA is designated SEQ ID:1218, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1218 is located at position 14553 relative to the genome of Equine herpesvirus 2.

[17206] VGAM1232 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1232 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17207] An enzyme complex designated DICER COMPLEX, dices the VGAM1232 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1232 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM1232 RNA is designated SEQ ID:3943, and is provided hereinbelow with reference to the sequence listing part.

[17208] VGAM1232 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1232 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1232 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17209] VGAM1232 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1232 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1232 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1232 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1232 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17210] The complementary binding of VGAM1232 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1232 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1232 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1232 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17211] It is appreciated that VGAM1232 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1232 host target genes. The mRNA of each one of this plurality of VGAM1232 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1232 RNA, herein designated VGAM RNA, and which when bound by VGAM1232 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1232 host target proteins.

[17212] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1232 gene, herein designated VGAM GENE, on one or more VGAM1232 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17213] It is yet further appreciated that a function of VGAM1232 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1232 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Spe-

cific functions, and accordingly utilities, of VGAM1232 correlate with, and may be deduced from, the identity of the host target genes which VGAM1232 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17214] Nucleotide sequences of the VGAM1232 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM1232 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1232 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1232 are further described hereinbelow with reference to Table 1.

[17215] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1232 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17216] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1233 (VGAM1233) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[17217] VGAM1233 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1233 was detected is described hereinabove with reference to Figs. 2–8.

[17218] VGAM1233 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM1233 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17219] VGAM1233 gene, herein designated VGAM GENE, encodes a VGAM1233 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1233 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1233 precursor RNA is designated SEQ ID:1219, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1219 is located at position 11297 relative to the genome of Equine herpesvirus 2.

[17220] VGAM1233 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1233 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17221] An enzyme complex designated DICER COMPLEX, dices the VGAM1233 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1233 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1233 RNA is designated SEQ ID:3944, and is provided hereinbelow with reference to the sequence listing part.

[17222] VGAM1233 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1233 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1233 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17223] VGAM1233 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1233 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1233 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1233 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1233 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17224] The complementary binding of VGAM1233 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1233 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1233 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1233 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17225] It is appreciated that VGAM1233 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1233 host target genes. The mRNA of each one of this plurality of VGAM1233 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1233 RNA, herein designated VGAM RNA, and which when bound by VGAM1233 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1233 host target proteins.

[17226] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1233 gene, herein designated VGAM GENE, on one or more VGAM1233 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17227] It is yet further appreciated that a function of VGAM1233 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1233 include diagnosis, prevention and

treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1233 correlate with, and may be deduced from, the identity of the host target genes which VGAM1233 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17228] Nucleotide sequences of the VGAM1233 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1233 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1233 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1233 are further described hereinbelow with reference to Table 1.

[17229] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1233 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17230] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1234 (VGAM1234) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17231] VGAM1234 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1234 was detected is described hereinabove with reference to Figs. 2–8.

[17232] VGAM1234 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM1234 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17233] VGAM1234 gene, herein designated VGAM GENE, encodes a VGAM1234 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1234 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1234 precursor RNA is designated SEQ ID:1220, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1220 is located at position 11113 relative to the genome of Equine herpesvirus 2.

[17234] VGAM1234 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1234 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17235] An enzyme complex designated DICER COMPLEX, dices the VGAM1234 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1234 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM1234 RNA is designated SEQ ID:3945, and is provided hereinbelow with reference to the sequence listing part.

[17236] VGAM1234 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1234 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1234 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17237] VGAM1234 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1234 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1234 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1234 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1234 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17238] The complementary binding of VGAM1234 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1234 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1234 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1234 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17239] It is appreciated that VGAM1234 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1234 host target genes. The mRNA of each one of this plurality of VGAM1234 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1234 RNA, herein designated VGAM

RNA, and which when bound by VGAM1234 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1234 host target proteins.

[17240] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1234 gene, herein designated VGAM GENE, on one or more VGAM1234 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17241] It is yet further appreciated that a function of VGAM1234 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1234 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1234 correlate with, and may be deduced from, the identity of the host target genes which VGAM1234 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17242] Nucleotide sequences of the VGAM1234 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1234 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1234 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1234 are further described hereinbelow with reference to Table 1.

[17243] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1234 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17244] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1235 (VGAM1235) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17245] VGAM1235 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1235 was detected is described hereinabove with reference to Figs. 2-8.

[17246] VGAM1235 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4. VGAM1235 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17247] VGAM1235 gene, herein designated VGAM GENE, encodes a VGAM1235 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1235 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1235 precursor RNA is designated SEQ ID:1221, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1221 is located at position

102206 relative to the genome of Bovine herpesvirus 4.

[17248] VGAM1235 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1235 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17249] An enzyme complex designated DICER COMPLEX, dices the VGAM1235 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1235 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1235 RNA is designated SEQ ID:3946, and is provided hereinbelow with reference to the sequence listing part.

[17250] VGAM1235 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1235 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1235 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17251] VGAM1235 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1235 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1235 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1235 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1235 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17252] The complementary binding of VGAM1235 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1235 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1235 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1235 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17253] It is appreciated that VGAM1235 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1235 host target genes. The mRNA of each one of this plurality of VGAM1235 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1235 RNA, herein designated VGAM RNA, and which when bound by VGAM1235 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1235 host target proteins.

[17254] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1235 gene, herein designated VGAM GENE, on one or more VGAM1235 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17255] It is yet further appreciated that a function of VGAM1235 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1235 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1235 correlate with, and may be deduced from, the identity of the host target genes which VGAM1235 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17256] Nucleotide sequences of the VGAM1235 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1235 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1235 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1235 are further described hereinbelow with reference to Table 1.

[17257] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1235 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17258] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1236 (VGAM1236) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17259] VGAM1236 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1236 was detected is described hereinabove with reference to Figs. 2–8.

[17260] VGAM1236 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4. VGAM1236 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17261] VGAM1236 gene, herein designated VGAM GENE, encodes a VGAM1236 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1236 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1236 precursor RNA is designated SEQ ID:1222, and is provided hereinbelow with reference to the sequence listing part. Nu–

cleotide sequence SEQ ID:1222 is located at position 104518 relative to the genome of Bovine herpesvirus 4.

[17262] VGAM1236 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1236 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17263] An enzyme complex designated DICER COMPLEX, dices the VGAM1236 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1236 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1236 RNA is designated SEQ ID:3947, and is provided hereinbelow with reference to the sequence

listing part.

[17264] VGAM1236 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1236 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1236 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17265] VGAM1236 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1236 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1236 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1236 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1236 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17266] The complementary binding of VGAM1236 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1236 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1236 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1236 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17267] It is appreciated that VGAM1236 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1236 host target genes. The mRNA of each one of this plurality of VGAM1236 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1236 RNA, herein designated VGAM RNA, and which when bound by VGAM1236 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1236 host target proteins.

[17268] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1236 gene, herein designated VGAM GENE, on one or more VGAM1236 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17269] It is yet further appreciated that a function of VGAM1236

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1236 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1236 correlate with, and may be deduced from, the identity of the host target genes which VGAM1236 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17270] Nucleotide sequences of the VGAM1236 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1236 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1236 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1236 are further described hereinbelow with reference to Table 1.

[17271] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1236 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17272] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1237 (VGAM1237) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17273] VGAM1237 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1237 was detected is described hereinabove with reference to Figs. 2–8.

[17274] VGAM1237 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4. VGAM1237 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17275] VGAM1237 gene, herein designated VGAM GENE, encodes a VGAM1237 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1237 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1237 precursor RNA is designated SEQ ID:1223, and is provided here–

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1223 is located at position 100957 relative to the genome of Bovine herpesvirus 4.

[17276] VGAM1237 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1237 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17277] An enzyme complex designated DICER COMPLEX, dices the VGAM1237 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1237 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM1237 RNA is designated SEQ ID:3948, and

is provided hereinbelow with reference to the sequence listing part.

[17278] VGAM1237 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1237 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1237 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17279] VGAM1237 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1237 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1237 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1237 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1237 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17280] The complementary binding of VGAM1237 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1237 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1237 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1237 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17281] It is appreciated that VGAM1237 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1237 host target genes. The mRNA of each one of this plurality of VGAM1237 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1237 RNA, herein designated VGAM RNA, and which when bound by VGAM1237 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1237 host target proteins.

[17282] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1237 gene, herein designated VGAM GENE, on one or more VGAM1237 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17283] It is yet further appreciated that a function of VGAM1237 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1237 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1237 correlate with, and may be deduced from, the identity of the host target genes which VGAM1237 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17284] Nucleotide sequences of the VGAM1237 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM1237 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1237 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1237 are further described hereinbelow with reference to Table 1.

[17285] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1237 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17286] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1238 (VGAM1238) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17287] VGAM1238 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1238 was detected is described hereinabove with reference to Figs. 2–8.

[17288] VGAM1238 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4. VGAM1238 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17289] VGAM1238 gene, herein designated VGAM GENE, encodes a VGAM1238 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1238 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1238 precu-

sor RNA is designated SEQ ID:1224, and is provided herein below with reference to the sequence listing part. Nucleotide sequence SEQ ID:1224 is located at position 105956 relative to the genome of Bovine herpesvirus 4.

[17290] VGAM1238 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1238 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17291] An enzyme complex designated DICER COMPLEX, dices the VGAM1238 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1238 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide se-

quence of VGAM1238 RNA is designated SEQ ID:3949, and is provided hereinbelow with reference to the sequence listing part.

[17292] VGAM1238 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1238 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1238 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17293] VGAM1238 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1238 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1238 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1238 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1238 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17294] The complementary binding of VGAM1238 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1238 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1238 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1238 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17295] It is appreciated that VGAM1238 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1238 host target genes. The mRNA of

each one of this plurality of VGAM1238 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1238 RNA, herein designated VGAM RNA, and which when bound by VGAM1238 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1238 host target proteins.

[17296] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1238 gene, herein designated VGAM GENE, on one or more VGAM1238 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[17297] It is yet further appreciated that a function of VGAM1238 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1238 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1238 correlate with, and may be deduced from, the identity of the host target genes which VGAM1238 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17298] Nucleotide sequences of the VGAM1238 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1238 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1238 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1238 are further described hereinbelow with reference to Table 1.

[17299] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1238 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[17300] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1239 (VGAM1239) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17301] VGAM1239 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1239 was detected is described hereinabove with reference to Figs. 2–8.

[17302] VGAM1239 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4. VGAM1239 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17303] VGAM1239 gene, herein designated VGAM GENE, encodes a VGAM1239 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1239 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1239 precursor RNA is designated SEQ ID:1225, and is provided herein below with reference to the sequence listing part. Nucleotide sequence SEQ ID:1225 is located at position 106225 relative to the genome of Bovine herpesvirus 4.

[17304] VGAM1239 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1239 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17305] An enzyme complex designated DICER COMPLEX, dices the VGAM1239 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1239 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 56%) nucleotide sequence of VGAM1239 RNA is designated SEQ ID:3950, and is provided hereinbelow with reference to the sequence listing part.

[17306] VGAM1239 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1239 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1239 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17307] VGAM1239 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1239 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1239 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1239 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1239 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17308] The complementary binding of VGAM1239 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1239 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1239 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1239 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17309] It is appreciated that VGAM1239 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1239 host target genes. The mRNA of each one of this plurality of VGAM1239 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1239 RNA, herein designated VGAM RNA, and which when bound by VGAM1239 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1239 host target proteins.

[17310] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1239 gene, herein designated VGAM GENE, on one or more VGAM1239 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [17311] It is yet further appreciated that a function of VGAM1239 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1239 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1239 correlate with, and may be deduced from, the identity of the host target genes which VGAM1239 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [17312] Nucleotide sequences of the VGAM1239 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM1239 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1239 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1239 are further described hereinbelow with reference to Table 1.
- [17313] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1239 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17314] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1240 (VGAM1240) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17315] VGAM1240 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1240 was detected is described hereinabove with reference to Figs. 2-8.

[17316] VGAM1240 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4. VGAM1240 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17317] VGAM1240 gene, herein designated VGAM GENE, encodes a VGAM1240 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1240 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1240 precursor RNA is designated SEQ ID:1226, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1226 is located at position 100575 relative to the genome of Bovine herpesvirus 4.

[17318] VGAM1240 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1240 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17319] An enzyme complex designated DICER COMPLEX, dices the VGAM1240 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1240 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM1240 RNA is designated SEQ ID:3951, and is provided hereinbelow with reference to the sequence listing part.

[17320] VGAM1240 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1240 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1240 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17321] VGAM1240 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1240 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1240 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1240 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1240 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17322] The complementary binding of VGAM1240 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1240 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1240 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1240 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17323] It is appreciated that VGAM1240 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1240 host target genes. The mRNA of each one of this plurality of VGAM1240 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1240 RNA, herein designated VGAM RNA, and which when bound by VGAM1240 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1240 host target proteins.

[17324] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1240 gene, herein designated VGAM GENE, on one or more VGAM1240 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17325] It is yet further appreciated that a function of VGAM1240 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1240 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1240 correlate with, and may be deduced from, the identity of the host target genes which VGAM1240 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17326] Nucleotide sequences of the VGAM1240 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1240 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1240 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1240 are further described hereinbelow with reference to Table 1.

[17327] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1240 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17328] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1241 (VGAM1241) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17329] VGAM1241 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1241 was detected is described hereinabove with reference to Figs. 2–8.

[17330] VGAM1241 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 3. VGAM1241 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17331] VGAM1241 gene, herein designated VGAM GENE, encodes a VGAM1241 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1241 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1241 precursor RNA is designated SEQ ID:1227, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1227 is located at position 107745 relative to the genome of Gallid herpesvirus 3.

[17332] VGAM1241 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1241 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17333] An enzyme complex designated DICER COMPLEX, dices the VGAM1241 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1241 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM1241 RNA is designated SEQ ID:3952, and is provided hereinbelow with reference to the sequence listing part.

[17334] VGAM1241 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1241 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1241 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17335] VGAM1241 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1241 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1241 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1241 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1241 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17336] The complementary binding of VGAM1241 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1241 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1241 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1241 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17337] It is appreciated that VGAM1241 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1241 host target genes. The mRNA of each one of this plurality of VGAM1241 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1241 RNA, herein designated VGAM RNA, and which when bound by VGAM1241 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1241 host target proteins.

[17338] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1241 gene, herein designated VGAM GENE, on one or more VGAM1241 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17339] It is yet further appreciated that a function of VGAM1241 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1241 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1241 correlate with, and may be deduced from, the identity of the host target genes which VGAM1241 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17340] Nucleotide sequences of the VGAM1241 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1241 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1241 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1241 are further described hereinbelow with reference to Table 1.

[17341] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1241 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17342] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1242 (VGAM1242) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17343] VGAM1242 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1242 was detected is described hereinabove with reference to Figs. 2–8.

[17344] VGAM1242 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 3. VGAM1242 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17345] VGAM1242 gene, herein designated VGAM GENE, encodes a VGAM1242 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1242 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1242 precursor

sor RNA is designated SEQ ID:1228, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1228 is located at position 101522 relative to the genome of Gallid herpesvirus 3.

[17346] VGAM1242 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1242 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17347] An enzyme complex designated DICER COMPLEX, dices the VGAM1242 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1242 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide se-

quence of VGAM1242 RNA is designated SEQ ID:3953, and is provided hereinbelow with reference to the sequence listing part.

[17348] VGAM1242 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1242 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1242 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17349] VGAM1242 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1242 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1242 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1242 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1242 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17350] The complementary binding of VGAM1242 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1242 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1242 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1242 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17351] It is appreciated that VGAM1242 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1242 host target genes. The mRNA of

each one of this plurality of VGAM1242 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1242 RNA, herein designated VGAM RNA, and which when bound by VGAM1242 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1242 host target proteins.

[17352] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1242 gene, herein designated VGAM GENE, on one or more VGAM1242 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[17353] It is yet further appreciated that a function of VGAM1242 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1242 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1242 correlate with, and may be deduced from, the identity of the host target genes which VGAM1242 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17354] Nucleotide sequences of the VGAM1242 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1242 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1242 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1242 are further described hereinbelow with reference to Table 1.

[17355] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1242 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[17356] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1243 (VGAM1243) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17357] VGAM1243 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1243 was detected is described hereinabove with reference to Figs. 2–8.

[17358] VGAM1243 gene, herein designated VGAM GENE, is a viral gene contained in the genome of turkey adenovirus 3. VGAM1243 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17359] VGAM1243 gene, herein designated VGAM GENE, encodes a VGAM1243 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1243 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1243 precursor RNA is designated SEQ ID:1229, and is provided herein below with reference to the sequence listing part. Nucleotide sequence SEQ ID:1229 is located at position 18764 relative to the genome of turkey adenovirus 3.

[17360] VGAM1243 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1243 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17361] An enzyme complex designated DICER COMPLEX, dices the VGAM1243 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1243 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1243 RNA is designated SEQ ID:3954, and is provided hereinbelow with reference to the sequence listing part.

[17362] VGAM1243 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1243 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1243 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17363] VGAM1243 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1243 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1243 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1243 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1243 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17364] The complementary binding of VGAM1243 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1243 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1243 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1243 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17365] It is appreciated that VGAM1243 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1243 host target genes. The mRNA of each one of this plurality of VGAM1243 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1243 RNA, herein designated VGAM RNA, and which when bound by VGAM1243 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1243 host target proteins.

[17366] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1243 gene, herein designated VGAM GENE, on one or more VGAM1243 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [17367] It is yet further appreciated that a function of VGAM1243 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1243 include diagnosis, prevention and treatment of viral infection by turkey adenovirus 3. Specific functions, and accordingly utilities, of VGAM1243 correlate with, and may be deduced from, the identity of the host target genes which VGAM1243 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [17368] Nucleotide sequences of the VGAM1243 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1243 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1243 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1243 are further described hereinbelow with reference to Table 1.
- [17369] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1243 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17370] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1244 (VGAM1244) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17371] VGAM1244 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1244 was detected is described hereinabove with reference to Figs. 2-8.

[17372] VGAM1244 gene, herein designated VGAM GENE, is a viral gene contained in the genome of turkey adenovirus 3. VGAM1244 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17373] VGAM1244 gene, herein designated VGAM GENE, encodes a VGAM1244 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1244 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1244 precursor RNA is designated SEQ ID:1230, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1230 is located at position 24452 relative to the genome of turkey adenovirus 3.

[17374] VGAM1244 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1244 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17375] An enzyme complex designated DICER COMPLEX, dices the VGAM1244 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1244 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM1244 RNA is designated SEQ ID:3955, and is provided hereinbelow with reference to the sequence listing part.

[17376] VGAM1244 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1244 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1244 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17377] VGAM1244 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1244 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1244 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1244 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1244 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17378] The complementary binding of VGAM1244 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1244 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1244 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1244 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17379] It is appreciated that VGAM1244 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1244 host target genes. The mRNA of each one of this plurality of VGAM1244 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1244 RNA, herein designated VGAM RNA, and which when bound by VGAM1244 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1244 host target proteins.

[17380] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1244 gene, herein designated VGAM GENE, on one or more VGAM1244 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17381] It is yet further appreciated that a function of VGAM1244 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1244 include diagnosis, prevention and treatment of viral infection by turkey adenovirus 3. Specific functions, and accordingly utilities, of VGAM1244 correlate with, and may be deduced from, the identity of the host target genes which VGAM1244 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17382] Nucleotide sequences of the VGAM1244 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1244 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1244 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1244 are further described hereinbelow with reference to Table 1.

[17383] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1244 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17384] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1245 (VGAM1245) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17385] VGAM1245 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1245 was detected is described hereinabove with reference to Figs. 2–8.

[17386] VGAM1245 gene, herein designated VGAM GENE, is a viral gene contained in the genome of turkey adenovirus 3. VGAM1245 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17387] VGAM1245 gene, herein designated VGAM GENE, encodes a VGAM1245 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1245 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1245 precursor RNA is designated SEQ ID:1231, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1231 is located at position 19532 relative to the genome of turkey adenovirus 3.

[17388] VGAM1245 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1245 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17389] An enzyme complex designated DICER COMPLEX, dices the VGAM1245 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1245 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1245 RNA is designated SEQ ID:3956, and is provided hereinbelow with reference to the sequence listing part.

[17390] VGAM1245 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1245 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1245 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17391] VGAM1245 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1245 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1245 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1245 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1245 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17392] The complementary binding of VGAM1245 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1245 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1245 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1245 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17393] It is appreciated that VGAM1245 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1245 host target genes. The mRNA of each one of this plurality of VGAM1245 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1245 RNA, herein designated VGAM RNA, and which when bound by VGAM1245 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1245 host target proteins.

[17394] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1245 gene, herein designated VGAM GENE, on one or more VGAM1245 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17395] It is yet further appreciated that a function of VGAM1245 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1245 include diagnosis, prevention and treatment of viral infection by turkey adenovirus 3. Specific functions, and accordingly utilities, of VGAM1245 correlate with, and may be deduced from, the identity of the host target genes which VGAM1245 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17396] Nucleotide sequences of the VGAM1245 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1245 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1245 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1245 are further described hereinbelow with reference to Table 1.

[17397] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1245 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17398] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1246 (VGAM1246) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17399] VGAM1246 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1246 was detected is described hereinabove with reference to Figs. 2-8.

[17400] VGAM1246 gene, herein designated VGAM GENE, is a viral gene contained in the genome of turkey adenovirus 3. VGAM1246 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17401] VGAM1246 gene, herein designated VGAM GENE, encodes a VGAM1246 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1246 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1246 precursor RNA is designated SEQ ID:1232, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1232 is located at position 24059 relative to the genome of turkey adenovirus 3.

[17402] VGAM1246 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1246 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17403] An enzyme complex designated DICER COMPLEX, dices the VGAM1246 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1246 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1246 RNA is designated SEQ ID:3957, and is provided hereinbelow with reference to the sequence listing part.

[17404] VGAM1246 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1246 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1246 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17405] VGAM1246 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1246 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1246 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1246 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1246 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17406] The complementary binding of VGAM1246 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1246 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1246 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1246 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[17407] It is appreciated that VGAM1246 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1246 host target genes. The mRNA of each one of this plurality of VGAM1246 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1246 RNA, herein designated VGAM RNA, and which when bound by VGAM1246 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1246 host target proteins.

[17408] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1246 gene, herein designated VGAM GENE, on one or more VGAM1246 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17409] It is yet further appreciated that a function of VGAM1246 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1246 include diagnosis, prevention and treatment of viral infection by turkey adenovirus 3. Specific functions, and accordingly utilities, of VGAM1246 correlate with, and may be deduced from, the identity of the host target genes which VGAM1246 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17410] Nucleotide sequences of the VGAM1246 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM1246 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1246 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1246 are further described hereinbelow with reference to Table 1.

[17411] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1246 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17412] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1247 (VGAM1247) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17413] VGAM1247 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1247 was detected is described hereinabove with reference to Figs. 2-8.

[17414] VGAM1247 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM1247 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17415] VGAM1247 gene, herein designated VGAM GENE, encodes a VGAM1247 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1247 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1247 precursor RNA is designated SEQ ID:1233, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1233 is located at position 132081 relative to the genome of Monkeypox virus.

[17416] VGAM1247 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1247 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17417] An enzyme complex designated DICER COMPLEX, dices the VGAM1247 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1247 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1247 RNA is designated SEQ ID:3958, and is provided hereinbelow with reference to the sequence listing part.

[17418] VGAM1247 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1247 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1247 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17419] VGAM1247 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1247 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1247 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1247 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1247 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17420] The complementary binding of VGAM1247 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1247 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1247 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1247 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17421] It is appreciated that VGAM1247 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1247 host target genes. The mRNA of each one of this plurality of VGAM1247 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1247 RNA, herein designated VGAM RNA, and which when bound by VGAM1247 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1247 host target proteins.

[17422] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1247 gene, herein designated VGAM GENE, on one or more VGAM1247 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17423] It is yet further appreciated that a function of VGAM1247 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1247 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM1247 correlate with, and may be deduced from, the identity of the host target genes which VGAM1247 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17424] Nucleotide sequences of the VGAM1247 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1247 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1247 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1247 are further described hereinbelow with reference to Table 1.

[17425] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1247 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17426] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1248 (VGAM1248) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17427] VGAM1248 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1248 was detected is described hereinabove with reference to Figs. 2-8.

[17428] VGAM1248 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM1248 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17429] VGAM1248 gene, herein designated VGAM GENE, encodes

a VGAM1248 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1248 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1248 precursor RNA is designated SEQ ID:1234, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1234 is located at position 131818 relative to the genome of Monkeypox virus.

[17430] VGAM1248 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1248 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17431] An enzyme complex designated DICER COMPLEX, dices the VGAM1248 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1248 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM1248 RNA is designated SEQ ID:3959, and is provided hereinbelow with reference to the sequence listing part.

[17432] VGAM1248 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1248 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1248 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17433] VGAM1248 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1248 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1248 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1248 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1248 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17434] The complementary binding of VGAM1248 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1248 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1248 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1248 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17435] It is appreciated that VGAM1248 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1248 host target genes. The mRNA of each one of this plurality of VGAM1248 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1248 RNA, herein designated VGAM RNA, and which when bound by VGAM1248 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1248 host target proteins.

[17436] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1248 gene, herein designated VGAM GENE, on one or more VGAM1248 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17437] It is yet further appreciated that a function of VGAM1248 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1248 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM1248 correlate with, and may be deduced from, the identity of the host target genes which VGAM1248 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17438] Nucleotide sequences of the VGAM1248 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM1248 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1248 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1248 are further

described hereinbelow with reference to Table 1.

[17439] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1248 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17440] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1249 (VGAM1249) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17441] VGAM1249 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1249 was detected is described hereinabove with reference to Figs. 2-8.

[17442] VGAM1249 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM1249 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17443] VGAM1249 gene, herein designated VGAM GENE, encodes a VGAM1249 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1249 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1249 precursor RNA is designated SEQ ID:1235, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1235 is located at position 130478 relative to the genome of Monkeypox virus.

[17444] VGAM1249 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1249 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17445] An enzyme complex designated DICER COMPLEX, dices the VGAM1249 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1249 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM1249 RNA is designated SEQ ID:3960, and is provided hereinbelow with reference to the sequence listing part.

[17446] VGAM1249 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1249 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1249 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17447] VGAM1249 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1249 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1249 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1249 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1249 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17448] The complementary binding of VGAM1249 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1249 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1249

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1249 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17449] It is appreciated that VGAM1249 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1249 host target genes. The mRNA of each one of this plurality of VGAM1249 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1249 RNA, herein designated VGAM RNA, and which when bound by VGAM1249 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1249 host target proteins.

[17450] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1249 gene, herein designated VGAM GENE, on one or more VGAM1249 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17451] It is yet further appreciated that a function of VGAM1249 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1249 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM1249 correlate with, and may be deduced from, the identity of the host target genes which VGAM1249 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17452] Nucleotide sequences of the VGAM1249 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1249 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1249 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1249 are further described hereinbelow with reference to Table 1.

[17453] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1249 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17454] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1250 (VGAM1250) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17455] VGAM1250 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1250 was detected is described hereinabove with reference to Figs. 2-8.

[17456] VGAM1250 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM1250 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[17457] VGAM1250 gene, herein designated VGAM GENE, encodes a VGAM1250 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1250 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1250 precursor RNA is designated SEQ ID:1236, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1236 is located at position 136377 relative to the genome of Camelpox virus.

[17458] VGAM1250 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1250 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17459] An enzyme complex designated DICER COMPLEX, dices

the VGAM1250 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1250 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1250 RNA is designated SEQ ID:3961, and is provided hereinbelow with reference to the sequence listing part.

[17460] VGAM1250 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1250 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1250 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17461] VGAM1250 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1250 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1250 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1250 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1250 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17462] The complementary binding of VGAM1250 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1250 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1250 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1250 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17463] It is appreciated that VGAM1250 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1250 host target genes. The mRNA of each one of this plurality of VGAM1250 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1250 RNA, herein designated VGAM RNA, and which when bound by VGAM1250 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1250 host target proteins.

[17464] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1250 gene, herein designated VGAM GENE, on one or more VGAM1250 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17465] It is yet further appreciated that a function of VGAM1250 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1250 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM1250 correlate with, and may be deduced from, the identity of the host target genes which VGAM1250 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17466] Nucleotide sequences of the VGAM1250 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1250 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1250 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1250 are further described hereinbelow with reference to Table 1.

[17467] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1250 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17468] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1251 (VGAM1251) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17469] VGAM1251 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1251 was detected is described hereinabove with reference to Figs. 2-8.

[17470] VGAM1251 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM1251 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[17471] VGAM1251 gene, herein designated VGAM GENE, encodes a VGAM1251 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1251 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1251 precursor RNA is designated SEQ ID:1237, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1237 is located at position 132303 relative to the genome of Monkeypox virus.

[17472] VGAM1251 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1251 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17473] An enzyme complex designated DICER COMPLEX, dices the VGAM1251 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1251 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1251 RNA is designated SEQ ID:3962, and is provided hereinbelow with reference to the sequence listing part.

[17474] VGAM1251 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1251 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1251 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17475] VGAM1251 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1251 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1251 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1251 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1251 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17476] The complementary binding of VGAM1251 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1251 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1251 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1251 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17477] It is appreciated that VGAM1251 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1251 host target genes. The mRNA of each one of this plurality of VGAM1251 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1251 RNA, herein designated VGAM RNA, and which when bound by VGAM1251 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1251 host target proteins.

[17478] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1251 gene, herein designated VGAM GENE, on one or more VGAM1251 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17479] It is yet further appreciated that a function of VGAM1251 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1251 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM1251 correlate with, and may be deduced from, the identity of the host target genes which VGAM1251 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17480] Nucleotide sequences of the VGAM1251 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1251 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1251 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1251 are further described hereinbelow with reference to Table 1.

[17481] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1251 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17482] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1252 (VGAM1252) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17483] VGAM1252 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1252 was detected is described hereinabove with reference to Figs. 2-8.

[17484] VGAM1252 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus D.

VGAM1252 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17485] VGAM1252 gene, herein designated VGAM GENE, encodes a VGAM1252 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1252 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1252 precursor RNA is designated SEQ ID:1238, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1238 is located at position 5977 relative to the genome of Human adenovirus D.

[17486] VGAM1252 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1252 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[17487] An enzyme complex designated DICER COMPLEX, dices the VGAM1252 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1252 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM1252 RNA is designated SEQ ID:3963, and is provided hereinbelow with reference to the sequence listing part.

[17488] VGAM1252 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1252 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1252 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17489] VGAM1252 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1252 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1252 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1252 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1252 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17490] The complementary binding of VGAM1252 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1252 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1252 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1252 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17491] It is appreciated that VGAM1252 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1252 host target genes. The mRNA of each one of this plurality of VGAM1252 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1252 RNA, herein designated VGAM RNA, and which when bound by VGAM1252 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1252 host target proteins.

[17492] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1252 gene, herein designated VGAM GENE, on one or more VGAM1252 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17493] It is yet further appreciated that a function of VGAM1252 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1252 include diagnosis, prevention and treatment of viral infection by Human adenovirus D. Specific functions, and accordingly utilities, of VGAM1252 correlate with, and may be deduced from, the identity of the host target genes which VGAM1252 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17494] Nucleotide sequences of the VGAM1252 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1252 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1252 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1252 are further described hereinbelow with reference to Table 1.

[17495] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1252 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17496] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1253 (VGAM1253) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17497] VGAM1253 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1253 was detected is described hereinabove with reference to Figs. 2-8.

[17498] VGAM1253 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Human adenovirus D. VGAM1253 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17499] VGAM1253 gene, herein designated VGAM GENE, encodes a VGAM1253 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1253 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1253 precursor RNA is designated SEQ ID:1239, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1239 is located at position 8179 relative to the genome of Human adenovirus D.

[17500] VGAM1253 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1253 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17501] An enzyme complex designated DICER COMPLEX, dices the VGAM1253 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1253 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1253 RNA is designated SEQ ID:3964, and is provided hereinbelow with reference to the sequence listing part.

[17502] VGAM1253 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1253 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1253 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17503] VGAM1253 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1253 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1253 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1253 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1253 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17504] The complementary binding of VGAM1253 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1253 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1253 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1253 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17505] It is appreciated that VGAM1253 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1253 host target genes. The mRNA of each one of this plurality of VGAM1253 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1253 RNA, herein designated VGAM RNA, and which when bound by VGAM1253 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1253 host target proteins.

[17506] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1253 gene, herein designated VGAM GENE, on one or more VGAM1253 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17507] It is yet further appreciated that a function of VGAM1253 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1253 include diagnosis, prevention and treatment of viral infection by Human adenovirus D. Specific functions, and accordingly utilities, of VGAM1253 correlate with, and may be deduced from, the identity of the host target genes which VGAM1253 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17508] Nucleotide sequences of the VGAM1253 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1253 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1253 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1253 are further described hereinbelow with reference to Table 1.

[17509] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1253 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17510] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1254 (VGAM1254) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17511] VGAM1254 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1254 was detected is described hereinabove with reference to Figs. 2-8.

[17512] VGAM1254 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus D. VGAM1254 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17513] VGAM1254 gene, herein designated VGAM GENE, encodes a VGAM1254 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1254 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1254 precursor RNA is designated SEQ ID:1240, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1240 is located at position 8988 relative to the genome of Human adenovirus D.

[17514] VGAM1254 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1254 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17515] An enzyme complex designated DICER COMPLEX, dices the VGAM1254 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1254 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1254 RNA is designated SEQ ID:3965, and is provided hereinbelow with reference to the sequence listing part.

[17516] VGAM1254 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1254 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1254 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[17517] VGAM1254 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1254 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1254 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1254 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1254 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17518] The complementary binding of VGAM1254 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1254 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1254 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1254 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17519] It is appreciated that VGAM1254 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1254 host target genes. The mRNA of each one of this plurality of VGAM1254 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1254 RNA, herein designated VGAM RNA, and which when bound by VGAM1254 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1254 host target proteins.

[17520] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1254 gene, herein designated VGAM GENE, on one

or more VGAM1254 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17521] It is yet further appreciated that a function of VGAM1254 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1254 include diagnosis, prevention and treatment of viral infection by Human adenovirus D. Specific functions, and accordingly utilities, of VGAM1254 correlate with, and may be deduced from, the identity of the host target genes which VGAM1254 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17522] Nucleotide sequences of the VGAM1254 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1254 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1254 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1254 are further described hereinbelow with reference to Table 1.

[17523] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1254 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17524] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1255 (VGAM1255) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17525] VGAM1255 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1255 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[17526] VGAM1255 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus D. VGAM1255 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17527] VGAM1255 gene, herein designated VGAM GENE, encodes a VGAM1255 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1255 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1255 precursor RNA is designated SEQ ID:1241, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1241 is located at position 5672 relative to the genome of Human adenovirus D.

[17528] VGAM1255 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1255 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17529] An enzyme complex designated DICER COMPLEX, dices the VGAM1255 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1255 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1255 RNA is designated SEQ ID:3966, and is provided hereinbelow with reference to the sequence listing part.

[17530] VGAM1255 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1255 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1255 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17531] VGAM1255 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1255 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1255 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1255 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1255 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[17532] The complementary binding of VGAM1255 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1255 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1255 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1255 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17533] It is appreciated that VGAM1255 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1255 host target genes. The mRNA of each one of this plurality of VGAM1255 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1255 RNA, herein designated VGAM RNA, and which when bound by VGAM1255 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1255 host target proteins.

[17534] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1255 gene, herein designated VGAM GENE, on one or more VGAM1255 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17535] It is yet further appreciated that a function of VGAM1255 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1255 include diagnosis, prevention and treatment of viral infection by Human adenovirus D. Specific functions, and accordingly utilities, of VGAM1255 correlate with, and may be deduced from, the identity of the host target genes which VGAM1255 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[17536] Nucleotide sequences of the VGAM1255 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1255 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1255 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1255 are further described hereinbelow with reference to Table 1.

[17537] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1255 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17538] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1256 (VGAM1256) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17539] VGAM1256 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1256 was detected is described hereinabove with reference to Figs. 2–8.

[17540] VGAM1256 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus D. VGAM1256 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17541] VGAM1256 gene, herein designated VGAM GENE, encodes a VGAM1256 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1256 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1256 precursor RNA is designated SEQ ID:1242, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1242 is located at position 4027 relative to the genome of Human adenovirus D.

[17542] VGAM1256 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1256 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17543] An enzyme complex designated DICER COMPLEX, dices the VGAM1256 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1256 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1256 RNA is designated SEQ ID:3967, and is provided hereinbelow with reference to the sequence listing part.

[17544] VGAM1256 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1256 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1256 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17545] VGAM1256 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1256 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1256 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1256 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1256 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17546] The complementary binding of VGAM1256 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1256 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1256 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1256 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17547] It is appreciated that VGAM1256 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1256 host target genes. The mRNA of each one of this plurality of VGAM1256 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1256 RNA, herein designated VGAM RNA, and which when bound by VGAM1256 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1256 host target proteins.

[17548] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1256 gene, herein designated VGAM GENE, on one or more VGAM1256 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17549] It is yet further appreciated that a function of VGAM1256 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1256 include diagnosis, prevention and treatment of viral infection by Human adenovirus D. Specific functions, and accordingly utilities, of VGAM1256 correlate with, and may be deduced from, the identity of the host target genes which VGAM1256 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[17550] Nucleotide sequences of the VGAM1256 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1256 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1256 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1256 are further described hereinbelow with reference to Table 1.

[17551] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1256 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17552] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1257 (VGAM1257) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17553] VGAM1257 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1257 was detected is described hereinabove with reference to Figs. 2–8.

[17554] VGAM1257 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like disease virus. VGAM1257 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17555] VGAM1257 gene, herein designated VGAM GENE, encodes a VGAM1257 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1257 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1257 precursor RNA is designated SEQ ID:1243, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1243 is located at position 39908 relative to the genome of Yaba-like disease virus.

[17556] VGAM1257 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1257 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17557] An enzyme complex designated DICER COMPLEX, dices the VGAM1257 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1257 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1257 RNA is designated SEQ ID:3968, and is provided hereinbelow with reference to the sequence listing part.

[17558] VGAM1257 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1257 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1257 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17559] VGAM1257 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1257 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1257 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1257 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1257 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17560] The complementary binding of VGAM1257 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1257 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1257 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1257 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17561] It is appreciated that VGAM1257 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1257 host target genes. The mRNA of each one of this plurality of VGAM1257 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1257 RNA, herein designated VGAM RNA, and which when bound by VGAM1257 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1257 host target proteins.

[17562] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1257 gene, herein designated VGAM GENE, on one or more VGAM1257 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17563] It is yet further appreciated that a function of VGAM1257 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1257 include diagnosis, prevention and treatment of viral infection by Yaba-like disease virus. Specific functions, and accordingly utilities, of VGAM1257 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1257 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17564] Nucleotide sequences of the VGAM1257 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1257 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1257 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1257 are further described hereinbelow with reference to Table 1.

[17565] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1257 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17566] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1258 (VGAM1258) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17567] VGAM1258 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1258 was detected is described hereinabove with reference to Figs. 2–8.

[17568] VGAM1258 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like disease virus. VGAM1258 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17569] VGAM1258 gene, herein designated VGAM GENE, encodes a VGAM1258 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1258 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1258 precursor RNA is designated SEQ ID:1244, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1244 is located at position 40891 relative to the genome of Yaba-like disease virus.

[17570] VGAM1258 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1258 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17571] An enzyme complex designated DICER COMPLEX, dices the VGAM1258 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1258 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1258 RNA is designated SEQ ID:3969, and is provided hereinbelow with reference to the sequence listing part.

[17572] VGAM1258 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1258 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1258 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17573] VGAM1258 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1258 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1258 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1258 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1258 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17574] The complementary binding of VGAM1258 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1258 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1258 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1258 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17575] It is appreciated that VGAM1258 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1258 host target genes. The mRNA of each one of this plurality of VGAM1258 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1258 RNA, herein designated VGAM RNA, and which when bound by VGAM1258 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1258 host target proteins.

[17576] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1258 gene, herein designated VGAM GENE, on one or more VGAM1258 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17577] It is yet further appreciated that a function of VGAM1258 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1258 include diagnosis, prevention and treatment of viral infection by Yaba-like disease virus. Specific functions, and accordingly utilities, of VGAM1258

correlate with, and may be deduced from, the identity of the host target genes which VGAM1258 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17578] Nucleotide sequences of the VGAM1258 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1258 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1258 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1258 are further described hereinbelow with reference to Table 1.

[17579] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1258 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17580] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1259 (VGAM1259) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

- [17581] VGAM1259 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1259 was detected is described hereinabove with reference to Figs. 2–8.
- [17582] VGAM1259 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Blackcurrant reversion virus. VGAM1259 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.
- [17583] VGAM1259 gene, herein designated VGAM GENE, encodes a VGAM1259 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1259 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1259 precursor RNA is designated SEQ ID:1245, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1245 is located at position 4609 relative to the genome of Blackcurrant reversion virus.
- [17584] VGAM1259 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1259 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17585] An enzyme complex designated DICER COMPLEX, dices the VGAM1259 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1259 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM1259 RNA is designated SEQ ID:3970, and is provided hereinbelow with reference to the sequence listing part.

[17586] VGAM1259 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1259 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1259 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17587] VGAM1259 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1259 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1259 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1259 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1259 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17588] The complementary binding of VGAM1259 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1259 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1259 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1259 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17589] It is appreciated that VGAM1259 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1259 host target genes. The mRNA of each one of this plurality of VGAM1259 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1259 RNA, herein designated VGAM RNA, and which when bound by VGAM1259 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1259 host target proteins.

[17590] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1259 gene, herein designated VGAM GENE, on one or more VGAM1259 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17591] It is yet further appreciated that a function of VGAM1259 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1259 include diagnosis, prevention and treatment of viral infection by Blackcurrant reversion

virus. Specific functions, and accordingly utilities, of VGAM1259 correlate with, and may be deduced from, the identity of the host target genes which VGAM1259 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17592] Nucleotide sequences of the VGAM1259 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1259 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1259 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1259 are further described hereinbelow with reference to Table 1.

[17593] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1259 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17594] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1260 (VGAM1260) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[17595] VGAM1260 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1260 was detected is described hereinabove with reference to Figs. 2–8.

[17596] VGAM1260 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Blackcurrant reversion virus. VGAM1260 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17597] VGAM1260 gene, herein designated VGAM GENE, encodes a VGAM1260 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1260 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1260 precursor RNA is designated SEQ ID:1246, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1246 is located at position 1827 relative to the genome of Blackcurrant reversion virus.

[17598] VGAM1260 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1260 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17599] An enzyme complex designated DICER COMPLEX, dices the VGAM1260 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1260 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of VGAM1260 RNA is designated SEQ ID:3971, and is provided hereinbelow with reference to the sequence listing part.

[17600] VGAM1260 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1260 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1260 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17601] VGAM1260 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1260 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1260 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1260 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1260 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17602] The complementary binding of VGAM1260 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1260 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1260 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1260 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17603] It is appreciated that VGAM1260 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1260 host target genes. The mRNA of each one of this plurality of VGAM1260 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1260 RNA, herein designated VGAM RNA, and which when bound by VGAM1260 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1260 host target proteins.

[17604] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1260 gene, herein designated VGAM GENE, on one or more VGAM1260 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17605] It is yet further appreciated that a function of VGAM1260 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1260 include diagnosis, prevention and

treatment of viral infection by Blackcurrant reversion virus. Specific functions, and accordingly utilities, of VGAM1260 correlate with, and may be deduced from, the identity of the host target genes which VGAM1260 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17606] Nucleotide sequences of the VGAM1260 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1260 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1260 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1260 are further described hereinbelow with reference to Table 1.

[17607] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1260 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17608] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1261 (VGAM1261) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17609] VGAM1261 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1261 was detected is described hereinabove with reference to Figs. 2–8.

[17610] VGAM1261 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Blackcurrant reversion virus. VGAM1261 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17611] VGAM1261 gene, herein designated VGAM GENE, encodes a VGAM1261 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1261 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1261 precursor RNA is designated SEQ ID:1247, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1247 is located at position 2798 relative to the genome of Blackcurrant reversion virus.

[17612] VGAM1261 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1261 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17613] An enzyme complex designated DICER COMPLEX, dices the VGAM1261 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1261 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM1261 RNA is designated SEQ ID:3972, and is provided hereinbelow with reference to the sequence listing part.

[17614] VGAM1261 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1261 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1261 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17615] VGAM1261 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1261 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1261 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1261 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1261 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17616] The complementary binding of VGAM1261 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1261 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1261 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1261 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17617] It is appreciated that VGAM1261 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1261 host target genes. The mRNA of each one of this plurality of VGAM1261 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1261 RNA, herein designated VGAM

RNA, and which when bound by VGAM1261 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1261 host target proteins.

[17618] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1261 gene, herein designated VGAM GENE, on one or more VGAM1261 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17619] It is yet further appreciated that a function of VGAM1261 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1261 include diagnosis, prevention and treatment of viral infection by Blackcurrant reversion virus. Specific functions, and accordingly utilities, of VGAM1261 correlate with, and may be deduced from, the identity of the host target genes which VGAM1261 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17620] Nucleotide sequences of the VGAM1261 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1261 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1261 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1261 are further described hereinbelow with reference to Table 1.

[17621] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1261 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17622] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1262 (VGAM1262) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17623] VGAM1262 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1262 was detected is described hereinabove with reference to Figs. 2-8.

[17624] VGAM1262 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Blackcurrant reversion virus. VGAM1262 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17625] VGAM1262 gene, herein designated VGAM GENE, encodes a VGAM1262 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1262 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1262 precursor RNA is designated SEQ ID:1248, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1248 is located at position 3891

relative to the genome of Blackcurrant reversion virus.

[17626] VGAM1262 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1262 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17627] An enzyme complex designated DICER COMPLEX, dices the VGAM1262 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1262 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1262 RNA is designated SEQ ID:3973, and is provided hereinbelow with reference to the sequence listing part.

[17628] VGAM1262 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1262 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1262 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17629] VGAM1262 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1262 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1262 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1262 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1262 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17630] The complementary binding of VGAM1262 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1262 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1262 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1262 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17631] It is appreciated that VGAM1262 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1262 host target genes. The mRNA of each one of this plurality of VGAM1262 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1262 RNA, herein designated VGAM RNA, and which when bound by VGAM1262 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1262 host target proteins.

[17632] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1262 gene, herein designated VGAM GENE, on one or more VGAM1262 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17633] It is yet further appreciated that a function of VGAM1262 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1262 include diagnosis, prevention and treatment of viral infection by Blackcurrant reversion virus. Specific functions, and accordingly utilities, of VGAM1262 correlate with, and may be deduced from, the identity of the host target genes which VGAM1262 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17634] Nucleotide sequences of the VGAM1262 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1262 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1262 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1262 are further described hereinbelow with reference to Table 1.

[17635] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1262 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17636] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1263 (VGAM1263) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17637] VGAM1263 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1263 was detected is described hereinabove with reference to Figs. 2–8.

[17638] VGAM1263 gene, herein designated VGAM GENE, is a viral gene contained in the genome of beet soil-borne mosaic virus. VGAM1263 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17639] VGAM1263 gene, herein designated VGAM GENE, encodes a VGAM1263 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1263 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1263 precursor RNA is designated SEQ ID:1249, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:1249 is located at position 1764 relative to the genome of beet soil-borne mosaic virus.

[17640] VGAM1263 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1263 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17641] An enzyme complex designated DICER COMPLEX, dices the VGAM1263 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1263 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1263 RNA is designated SEQ ID:3974, and is provided hereinbelow with reference to the sequence

listing part.

[17642] VGAM1263 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1263 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1263 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17643] VGAM1263 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1263 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1263 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1263 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1263 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17644] The complementary binding of VGAM1263 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1263 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1263 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1263 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17645] It is appreciated that VGAM1263 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1263 host target genes. The mRNA of each one of this plurality of VGAM1263 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1263 RNA, herein designated VGAM RNA, and which when bound by VGAM1263 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1263 host target proteins.

[17646] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1263 gene, herein designated VGAM GENE, on one or more VGAM1263 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17647] It is yet further appreciated that a function of VGAM1263

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1263 include diagnosis, prevention and treatment of viral infection by beet soil-borne mosaic virus. Specific functions, and accordingly utilities, of VGAM1263 correlate with, and may be deduced from, the identity of the host target genes which VGAM1263 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17648] Nucleotide sequences of the VGAM1263 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1263 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1263 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1263 are further described hereinbelow with reference to Table 1.

[17649] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1263 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17650] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1264 (VGAM1264) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17651] VGAM1264 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1264 was detected is described hereinabove with reference to Figs. 2–8.

[17652] VGAM1264 gene, herein designated VGAM GENE, is a viral gene contained in the genome of beet soil-borne mosaic virus. VGAM1264 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17653] VGAM1264 gene, herein designated VGAM GENE, encodes a VGAM1264 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1264 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1264 precursor RNA is designated SEQ ID:1250, and is provided here–

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1250 is located at position 1403 relative to the genome of beet soil-borne mosaic virus.

[17654] VGAM1264 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1264 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17655] An enzyme complex designated DICER COMPLEX, dices the VGAM1264 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1264 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1264 RNA is designated SEQ ID:3975, and

is provided hereinbelow with reference to the sequence listing part.

[17656] VGAM1264 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1264 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1264 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17657] VGAM1264 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1264 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1264 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1264 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1264 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17658] The complementary binding of VGAM1264 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1264 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1264 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1264 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17659] It is appreciated that VGAM1264 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1264 host target genes. The mRNA of each one of this plurality of VGAM1264 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1264 RNA, herein designated VGAM RNA, and which when bound by VGAM1264 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1264 host target proteins.

[17660] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1264 gene, herein designated VGAM GENE, on one or more VGAM1264 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17661] It is yet further appreciated that a function of VGAM1264 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1264 include diagnosis, prevention and treatment of viral infection by beet soil-borne mosaic virus. Specific functions, and accordingly utilities, of VGAM1264 correlate with, and may be deduced from, the identity of the host target genes which VGAM1264 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17662] Nucleotide sequences of the VGAM1264 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1264 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1264 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1264 are further described hereinbelow with reference to Table 1.

[17663] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1264 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17664] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1265 (VGAM1265) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17665] VGAM1265 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1265 was detected is described hereinabove with reference to Figs. 2–8.

[17666] VGAM1265 gene, herein designated VGAM GENE, is a viral gene contained in the genome of beet soil-borne mosaic virus. VGAM1265 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17667] VGAM1265 gene, herein designated VGAM GENE, encodes a VGAM1265 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1265 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1265 precu-

sor RNA is designated SEQ ID:1251, and is provided herein below with reference to the sequence listing part. Nucleotide sequence SEQ ID:1251 is located at position 275 relative to the genome of beet soil-borne mosaic virus.

[17668] VGAM1265 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1265 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17669] An enzyme complex designated DICER COMPLEX, dices the VGAM1265 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1265 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide se-

quence of VGAM1265 RNA is designated SEQ ID:3976, and is provided hereinbelow with reference to the sequence listing part.

[17670] VGAM1265 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1265 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1265 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17671] VGAM1265 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1265 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1265 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1265 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1265 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17672] The complementary binding of VGAM1265 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1265 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1265 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1265 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17673] It is appreciated that VGAM1265 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1265 host target genes. The mRNA of

each one of this plurality of VGAM1265 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1265 RNA, herein designated VGAM RNA, and which when bound by VGAM1265 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1265 host target proteins.

[17674] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1265 gene, herein designated VGAM GENE, on one or more VGAM1265 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[17675] It is yet further appreciated that a function of VGAM1265 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1265 include diagnosis, prevention and treatment of viral infection by beet soil-borne mosaic virus. Specific functions, and accordingly utilities, of VGAM1265 correlate with, and may be deduced from, the identity of the host target genes which VGAM1265 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17676] Nucleotide sequences of the VGAM1265 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1265 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1265 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1265 are further described hereinbelow with reference to Table 1.

[17677] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1265 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[17678] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1266 (VGAM1266) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17679] VGAM1266 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1266 was detected is described hereinabove with reference to Figs. 2–8.

[17680] VGAM1266 gene, herein designated VGAM GENE, is a viral gene contained in the genome of beet soil-borne mosaic virus. VGAM1266 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17681] VGAM1266 gene, herein designated VGAM GENE, encodes a VGAM1266 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1266 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1266 precursor RNA is designated SEQ ID:1252, and is provided herein below with reference to the sequence listing part. Nucleotide sequence SEQ ID:1252 is located at position 1065 relative to the genome of beet soil-borne mosaic virus.

[17682] VGAM1266 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1266 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17683] An enzyme complex designated DICER COMPLEX, dices the VGAM1266 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1266 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 72%) nucleotide sequence of VGAM1266 RNA is designated SEQ ID:3977, and is provided hereinbelow with reference to the sequence listing part.

[17684] VGAM1266 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1266 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1266 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17685] VGAM1266 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1266 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1266 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1266 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1266 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17686] The complementary binding of VGAM1266 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1266 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1266 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1266 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17687] It is appreciated that VGAM1266 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1266 host target genes. The mRNA of each one of this plurality of VGAM1266 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1266 RNA, herein designated VGAM RNA, and which when bound by VGAM1266 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1266 host target proteins.

[17688] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1266 gene, herein designated VGAM GENE, on one or more VGAM1266 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [17689] It is yet further appreciated that a function of VGAM1266 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1266 include diagnosis, prevention and treatment of viral infection by beet soil-borne mosaic virus. Specific functions, and accordingly utilities, of VGAM1266 correlate with, and may be deduced from, the identity of the host target genes which VGAM1266 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [17690] Nucleotide sequences of the VGAM1266 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1266 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1266 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1266 are further described hereinbelow with reference to Table 1.
- [17691] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1266 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17692] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1267 (VGAM1267) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17693] VGAM1267 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1267 was detected is described hereinabove with reference to Figs. 2-8.

[17694] VGAM1267 gene, herein designated VGAM GENE, is a viral gene contained in the genome of beet soil-borne mosaic virus. VGAM1267 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17695] VGAM1267 gene, herein designated VGAM GENE, encodes a VGAM1267 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1267 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1267 precursor RNA is designated SEQ ID:1253, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1253 is located at position 1249 relative to the genome of beet soil-borne mosaic virus.

[17696] VGAM1267 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1267 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17697] An enzyme complex designated DICER COMPLEX, dices the VGAM1267 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1267 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1267 RNA is designated SEQ ID:3978, and is provided hereinbelow with reference to the sequence listing part.

[17698] VGAM1267 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1267 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1267 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17699] VGAM1267 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1267 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1267 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1267 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1267 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17700] The complementary binding of VGAM1267 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1267 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1267 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1267 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17701] It is appreciated that VGAM1267 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1267 host target genes. The mRNA of each one of this plurality of VGAM1267 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1267 RNA, herein designated VGAM RNA, and which when bound by VGAM1267 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1267 host target proteins.

[17702] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1267 gene, herein designated VGAM GENE, on one or more VGAM1267 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17703] It is yet further appreciated that a function of VGAM1267 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1267 include diagnosis, prevention and treatment of viral infection by beet soil-borne mosaic virus. Specific functions, and accordingly utilities, of VGAM1267 correlate with, and may be deduced from, the identity of the host target genes which VGAM1267 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17704] Nucleotide sequences of the VGAM1267 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1267 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1267 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1267 are further described hereinbelow with reference to Table 1.

[17705] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1267 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17706] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1268 (VGAM1268) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17707] VGAM1268 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1268 was detected is described hereinabove with reference to Figs. 2–8.

[17708] VGAM1268 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Grapevine virus A. VGAM1268 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17709] VGAM1268 gene, herein designated VGAM GENE, encodes a VGAM1268 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1268 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1268 precursor RNA is designated SEQ ID:1254, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1254 is located at position 6970 relative to the genome of Grapevine virus A.

[17710] VGAM1268 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1268 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17711] An enzyme complex designated DICER COMPLEX, dices the VGAM1268 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1268 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1268 RNA is designated SEQ ID:3979, and is provided hereinbelow with reference to the sequence listing part.

[17712] VGAM1268 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1268 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1268 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17713] VGAM1268 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1268 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1268 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1268 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1268 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17714] The complementary binding of VGAM1268 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1268 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1268 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1268 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17715] It is appreciated that VGAM1268 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1268 host target genes. The mRNA of each one of this plurality of VGAM1268 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1268 RNA, herein designated VGAM RNA, and which when bound by VGAM1268 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1268 host target proteins.

[17716] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1268 gene, herein designated VGAM GENE, on one or more VGAM1268 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17717] It is yet further appreciated that a function of VGAM1268 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1268 include diagnosis, prevention and treatment of viral infection by Grapevine virus A. Specific functions, and accordingly utilities, of VGAM1268 correlate with, and may be deduced from, the identity of the host target genes which VGAM1268 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17718] Nucleotide sequences of the VGAM1268 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1268 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1268 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1268 are further described hereinbelow with reference to Table 1.

[17719] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1268 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17720] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1269 (VGAM1269) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17721] VGAM1269 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1269 was detected is described hereinabove with reference to Figs. 2-8.

[17722] VGAM1269 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Grapevine virus A. VGAM1269 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17723] VGAM1269 gene, herein designated VGAM GENE, encodes a VGAM1269 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1269 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1269 precursor RNA is designated SEQ ID:1255, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1255 is located at position 2009 relative to the genome of Grapevine virus A.

[17724] VGAM1269 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1269 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17725] An enzyme complex designated DICER COMPLEX, dices the VGAM1269 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1269 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1269 RNA is designated SEQ ID:3980, and is provided hereinbelow with reference to the sequence listing part.

[17726] VGAM1269 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1269 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1269 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17727] VGAM1269 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1269 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1269 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1269 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1269 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17728] The complementary binding of VGAM1269 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1269 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1269 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1269 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[17729] It is appreciated that VGAM1269 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1269 host target genes. The mRNA of each one of this plurality of VGAM1269 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1269 RNA, herein designated VGAM RNA, and which when bound by VGAM1269 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1269 host target proteins.

[17730] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1269 gene, herein designated VGAM GENE, on one or more VGAM1269 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17731] It is yet further appreciated that a function of VGAM1269 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1269 include diagnosis, prevention and treatment of viral infection by Grapevine virus A. Specific functions, and accordingly utilities, of VGAM1269 correlate with, and may be deduced from, the identity of the host target genes which VGAM1269 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17732] Nucleotide sequences of the VGAM1269 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1269 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1269 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1269 are further described hereinbelow with reference to Table 1.

[17733] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1269 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17734] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1270 (VGAM1270) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17735] VGAM1270 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1270 was detected is described hereinabove with reference to Figs. 2-8.

[17736] VGAM1270 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Grapevine virus A. VGAM1270 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17737] VGAM1270 gene, herein designated VGAM GENE, encodes a VGAM1270 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1270 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1270 precursor RNA is designated SEQ ID:1256, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1256 is located at position 205 relative to the genome of Grapevine virus A.

[17738] VGAM1270 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1270 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17739] An enzyme complex designated DICER COMPLEX, dices the VGAM1270 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1270 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1270 RNA is designated SEQ ID:3981, and is provided hereinbelow with reference to the sequence listing part.

[17740] VGAM1270 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1270 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1270 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17741] VGAM1270 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1270 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1270 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1270 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1270 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17742] The complementary binding of VGAM1270 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1270 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1270 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1270 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17743] It is appreciated that VGAM1270 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1270 host target genes. The mRNA of each one of this plurality of VGAM1270 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1270 RNA, herein designated VGAM RNA, and which when bound by VGAM1270 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1270 host target proteins.

[17744] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1270 gene, herein designated VGAM GENE, on one or more VGAM1270 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17745] It is yet further appreciated that a function of VGAM1270 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1270 include diagnosis, prevention and treatment of viral infection by Grapevine virus A. Specific functions, and accordingly utilities, of VGAM1270 correlate with, and may be deduced from, the identity of the host target genes which VGAM1270 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17746] Nucleotide sequences of the VGAM1270 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1270 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1270 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1270 are further described hereinbelow with reference to Table 1.

[17747] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1270 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17748] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1271 (VGAM1271) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17749] VGAM1271 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1271 was detected is described hereinabove with reference to Figs. 2-8.

[17750] VGAM1271 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Grapevine virus A. VGAM1271 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17751] VGAM1271 gene, herein designated VGAM GENE, encodes

a VGAM1271 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1271 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1271 precursor RNA is designated SEQ ID:1257, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1257 is located at position 6496 relative to the genome of Grapevine virus A.

[17752] VGAM1271 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1271 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17753] An enzyme complex designated DICER COMPLEX, dices the VGAM1271 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1271 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1271 RNA is designated SEQ ID:3982, and is provided hereinbelow with reference to the sequence listing part.

[17754] VGAM1271 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1271 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1271 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17755] VGAM1271 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1271 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1271 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1271 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1271 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17756] The complementary binding of VGAM1271 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1271 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1271 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1271 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17757] It is appreciated that VGAM1271 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1271 host target genes. The mRNA of each one of this plurality of VGAM1271 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1271 RNA, herein designated VGAM RNA, and which when bound by VGAM1271 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1271 host target proteins.

[17758] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1271 gene, herein designated VGAM GENE, on one or more VGAM1271 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17759] It is yet further appreciated that a function of VGAM1271 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1271 include diagnosis, prevention and treatment of viral infection by Grapevine virus A. Specific functions, and accordingly utilities, of VGAM1271 correlate with, and may be deduced from, the identity of the host target genes which VGAM1271 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17760] Nucleotide sequences of the VGAM1271 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1271 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1271 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1271 are further

described hereinbelow with reference to Table 1.

[17761] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1271 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17762] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1272 (VGAM1272) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17763] VGAM1272 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1272 was detected is described hereinabove with reference to Figs. 2-8.

[17764] VGAM1272 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Grapevine virus A. VGAM1272 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17765] VGAM1272 gene, herein designated VGAM GENE, encodes a VGAM1272 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1272 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1272 precursor RNA is designated SEQ ID:1258, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1258 is located at position 2895 relative to the genome of Grapevine virus A.

[17766] VGAM1272 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1272 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17767] An enzyme complex designated DICER COMPLEX, dices the VGAM1272 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1272 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1272 RNA is designated SEQ ID:3983, and is provided hereinbelow with reference to the sequence listing part.

[17768] VGAM1272 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1272 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1272 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17769] VGAM1272 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1272 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1272 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1272 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1272 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17770] The complementary binding of VGAM1272 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1272 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1272

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1272 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17771] It is appreciated that VGAM1272 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1272 host target genes. The mRNA of each one of this plurality of VGAM1272 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1272 RNA, herein designated VGAM RNA, and which when bound by VGAM1272 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1272 host target proteins.

[17772] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1272 gene, herein designated VGAM GENE, on one or more VGAM1272 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17773] It is yet further appreciated that a function of VGAM1272 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1272 include diagnosis, prevention and treatment of viral infection by Grapevine virus A. Specific functions, and accordingly utilities, of VGAM1272 correlate with, and may be deduced from, the identity of the host target genes which VGAM1272 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17774] Nucleotide sequences of the VGAM1272 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1272 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1272 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1272 are further described hereinbelow with reference to Table 1.

[17775] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1272 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17776] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1273 (VGAM1273) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17777] VGAM1273 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1273 was detected is described hereinabove with reference to Figs. 2-8.

[17778] VGAM1273 gene, herein designated VGAM GENE, is a viral gene contained in the genome of A-2 plaque virus. VGAM1273 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[17779] VGAM1273 gene, herein designated VGAM GENE, encodes a VGAM1273 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1273 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1273 precursor RNA is designated SEQ ID:1259, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1259 is located at position 7172 relative to the genome of A-2 plaque virus.

[17780] VGAM1273 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1273 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17781] An enzyme complex designated DICER COMPLEX, dices

the VGAM1273 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1273 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of VGAM1273 RNA is designated SEQ ID:3984, and is provided hereinbelow with reference to the sequence listing part.

[17782] VGAM1273 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1273 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1273 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17783] VGAM1273 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1273 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1273 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1273 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1273 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17784] The complementary binding of VGAM1273 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1273 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1273 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1273 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17785] It is appreciated that VGAM1273 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1273 host target genes. The mRNA of each one of this plurality of VGAM1273 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1273 RNA, herein designated VGAM RNA, and which when bound by VGAM1273 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1273 host target proteins.

[17786] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1273 gene, herein designated VGAM GENE, on one or more VGAM1273 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17787] It is yet further appreciated that a function of VGAM1273 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1273 include diagnosis, prevention and treatment of viral infection by A-2 plaque virus. Specific functions, and accordingly utilities, of VGAM1273 correlate with, and may be deduced from, the identity of the host target genes which VGAM1273 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17788] Nucleotide sequences of the VGAM1273 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1273 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1273 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1273 are further described hereinbelow with reference to Table 1.

[17789] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1273 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17790] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1274 (VGAM1274) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17791] VGAM1274 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1274 was detected is described hereinabove with reference to Figs. 2-8.

[17792] VGAM1274 gene, herein designated VGAM GENE, is a viral gene contained in the genome of A-2 plaque virus. VGAM1274 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[17793] VGAM1274 gene, herein designated VGAM GENE, encodes a VGAM1274 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1274 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1274 precursor RNA is designated SEQ ID:1260, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1260 is located at position 5481 relative to the genome of A-2 plaque virus.

[17794] VGAM1274 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1274 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17795] An enzyme complex designated DICER COMPLEX, dices the VGAM1274 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1274 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1274 RNA is designated SEQ ID:3985, and is provided hereinbelow with reference to the sequence listing part.

[17796] VGAM1274 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1274 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1274 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17797] VGAM1274 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1274 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1274 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1274 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1274 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17798] The complementary binding of VGAM1274 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1274 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1274 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1274 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17799] It is appreciated that VGAM1274 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1274 host target genes. The mRNA of each one of this plurality of VGAM1274 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1274 RNA, herein designated VGAM RNA, and which when bound by VGAM1274 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1274 host target proteins.

[17800] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1274 gene, herein designated VGAM GENE, on one or more VGAM1274 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17801] It is yet further appreciated that a function of VGAM1274 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1274 include diagnosis, prevention and treatment of viral infection by A-2 plaque virus. Specific functions, and accordingly utilities, of VGAM1274 correlate with, and may be deduced from, the identity of the host target genes which VGAM1274 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17802] Nucleotide sequences of the VGAM1274 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1274 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1274 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1274 are further described hereinbelow with reference to Table 1.

[17803] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1274 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17804] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1275 (VGAM1275) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17805] VGAM1275 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1275 was detected is described hereinabove with reference to Figs. 2-8.

[17806] VGAM1275 gene, herein designated VGAM GENE, is a viral gene contained in the genome of A-2 plaque virus.

VGAM1275 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17807] VGAM1275 gene, herein designated VGAM GENE, encodes a VGAM1275 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1275 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1275 precursor RNA is designated SEQ ID:1261, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1261 is located at position 5027 relative to the genome of A-2 plaque virus.

[17808] VGAM1275 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1275 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[17809] An enzyme complex designated DICER COMPLEX, dices the VGAM1275 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1275 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1275 RNA is designated SEQ ID:3986, and is provided hereinbelow with reference to the sequence listing part.

[17810] VGAM1275 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1275 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1275 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17811] VGAM1275 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1275 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1275 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1275 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1275 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17812] The complementary binding of VGAM1275 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1275 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1275 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1275 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17813] It is appreciated that VGAM1275 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1275 host target genes. The mRNA of each one of this plurality of VGAM1275 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1275 RNA, herein designated VGAM RNA, and which when bound by VGAM1275 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1275 host target proteins.

[17814] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1275 gene, herein designated VGAM GENE, on one or more VGAM1275 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17815] It is yet further appreciated that a function of VGAM1275 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1275 include diagnosis, prevention and treatment of viral infection by A-2 plaque virus. Specific functions, and accordingly utilities, of VGAM1275 correlate with, and may be deduced from, the identity of the host target genes which VGAM1275 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17816] Nucleotide sequences of the VGAM1275 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1275 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1275 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1275 are further described hereinbelow with reference to Table 1.

[17817] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1275 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17818] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1276 (VGAM1276) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17819] VGAM1276 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1276 was detected is described hereinabove with reference to Figs. 2-8.

[17820] VGAM1276 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of A-2 plaque virus.

VGAM1276 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17821] VGAM1276 gene, herein designated VGAM GENE, encodes a VGAM1276 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1276 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1276 precursor RNA is designated SEQ ID:1262, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1262 is located at position 6716 relative to the genome of A-2 plaque virus.

[17822] VGAM1276 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1276 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17823] An enzyme complex designated DICER COMPLEX, dices the VGAM1276 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1276 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1276 RNA is designated SEQ ID:3987, and is provided hereinbelow with reference to the sequence listing part.

[17824] VGAM1276 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1276 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1276 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17825] VGAM1276 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1276 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1276 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1276 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1276 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17826] The complementary binding of VGAM1276 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1276 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1276 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1276 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17827] It is appreciated that VGAM1276 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1276 host target genes. The mRNA of each one of this plurality of VGAM1276 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1276 RNA, herein designated VGAM RNA, and which when bound by VGAM1276 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1276 host target proteins.

[17828] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1276 gene, herein designated VGAM GENE, on one or more VGAM1276 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17829] It is yet further appreciated that a function of VGAM1276 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1276 include diagnosis, prevention and treatment of viral infection by A-2 plaque virus. Specific functions, and accordingly utilities, of VGAM1276 correlate with, and may be deduced from, the identity of the host target genes which VGAM1276 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17830] Nucleotide sequences of the VGAM1276 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1276 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1276 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1276 are further described hereinbelow with reference to Table 1.

[17831] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1276 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17832] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1277 (VGAM1277) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17833] VGAM1277 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1277 was detected is described hereinabove with reference to Figs. 2-8.

[17834] VGAM1277 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human enterovirus C. VGAM1277 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17835] VGAM1277 gene, herein designated VGAM GENE, encodes a VGAM1277 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1277 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1277 precursor RNA is designated SEQ ID:1263, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1263 is located at position 156 relative to the genome of Human enterovirus C.

[17836] VGAM1277 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1277 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17837] An enzyme complex designated DICER COMPLEX, dices the VGAM1277 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1277 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1277 RNA is designated SEQ ID:3988, and is provided hereinbelow with reference to the sequence listing part.

[17838] VGAM1277 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1277 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1277 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[17839] VGAM1277 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1277 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1277 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1277 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1277 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17840] The complementary binding of VGAM1277 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1277 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1277 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1277 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17841] It is appreciated that VGAM1277 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1277 host target genes. The mRNA of each one of this plurality of VGAM1277 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1277 RNA, herein designated VGAM RNA, and which when bound by VGAM1277 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1277 host target proteins.

[17842] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1277 gene, herein designated VGAM GENE, on one

or more VGAM1277 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17843] It is yet further appreciated that a function of VGAM1277 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1277 include diagnosis, prevention and treatment of viral infection by Human enterovirus C. Specific functions, and accordingly utilities, of VGAM1277 correlate with, and may be deduced from, the identity of the host target genes which VGAM1277 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17844] Nucleotide sequences of the VGAM1277 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1277 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1277 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1277 are further described hereinbelow with reference to Table 1.

[17845] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1277 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17846] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1278 (VGAM1278) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17847] VGAM1278 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1278 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[17848] VGAM1278 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human enterovirus C. VGAM1278 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17849] VGAM1278 gene, herein designated VGAM GENE, encodes a VGAM1278 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1278 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1278 precursor RNA is designated SEQ ID:1264, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1264 is located at position 1945 relative to the genome of Human enterovirus C.

[17850] VGAM1278 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1278 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17851] An enzyme complex designated DICER COMPLEX, dices the VGAM1278 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1278 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1278 RNA is designated SEQ ID:3989, and is provided hereinbelow with reference to the sequence listing part.

[17852] VGAM1278 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1278 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1278 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17853] VGAM1278 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1278 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1278 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1278 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1278 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[17854] The complementary binding of VGAM1278 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1278 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1278 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1278 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17855] It is appreciated that VGAM1278 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1278 host target genes. The mRNA of each one of this plurality of VGAM1278 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1278 RNA, herein designated VGAM RNA, and which when bound by VGAM1278 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1278 host target proteins.

[17856] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1278 gene, herein designated VGAM GENE, on one or more VGAM1278 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17857] It is yet further appreciated that a function of VGAM1278 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1278 include diagnosis, prevention and treatment of viral infection by Human enterovirus C. Specific functions, and accordingly utilities, of VGAM1278 correlate with, and may be deduced from, the identity of the host target genes which VGAM1278 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[17858] Nucleotide sequences of the VGAM1278 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1278 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1278 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1278 are further described hereinbelow with reference to Table 1.

[17859] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1278 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17860] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1279 (VGAM1279) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17861] VGAM1279 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1279 was detected is described hereinabove with reference to Figs. 2–8.

[17862] VGAM1279 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human enterovirus C. VGAM1279 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17863] VGAM1279 gene, herein designated VGAM GENE, encodes a VGAM1279 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1279 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1279 precursor RNA is designated SEQ ID:1265, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1265 is located at position 1075 relative to the genome of Human enterovirus C.

[17864] VGAM1279 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1279 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17865] An enzyme complex designated DICER COMPLEX, dices the VGAM1279 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1279 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1279 RNA is designated SEQ ID:3990, and is provided hereinbelow with reference to the sequence listing part.

[17866] VGAM1279 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1279 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1279 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17867] VGAM1279 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1279 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1279 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1279 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1279 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17868] The complementary binding of VGAM1279 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1279 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1279 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1279 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17869] It is appreciated that VGAM1279 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1279 host target genes. The mRNA of each one of this plurality of VGAM1279 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1279 RNA, herein designated VGAM RNA, and which when bound by VGAM1279 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1279 host target proteins.

[17870] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1279 gene, herein designated VGAM GENE, on one or more VGAM1279 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17871] It is yet further appreciated that a function of VGAM1279 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1279 include diagnosis, prevention and treatment of viral infection by Human enterovirus C. Specific functions, and accordingly utilities, of VGAM1279 correlate with, and may be deduced from, the identity of the host target genes which VGAM1279 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[17872] Nucleotide sequences of the VGAM1279 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1279 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1279 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1279 are further described hereinbelow with reference to Table 1.

[17873] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1279 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17874] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1280 (VGAM1280) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17875] VGAM1280 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1280 was detected is described hereinabove with reference to Figs. 2–8.

[17876] VGAM1280 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human enterovirus C. VGAM1280 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17877] VGAM1280 gene, herein designated VGAM GENE, encodes a VGAM1280 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1280 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1280 precursor RNA is designated SEQ ID:1266, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1266 is located at position 1669 relative to the genome of Human enterovirus C.

[17878] VGAM1280 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1280 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17879] An enzyme complex designated DICER COMPLEX, dices the VGAM1280 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1280 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1280 RNA is designated SEQ ID:3991, and is provided hereinbelow with reference to the sequence listing part.

[17880] VGAM1280 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1280 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1280 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17881] VGAM1280 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1280 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1280 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1280 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1280 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17882] The complementary binding of VGAM1280 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1280 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1280 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1280 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17883] It is appreciated that VGAM1280 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1280 host target genes. The mRNA of each one of this plurality of VGAM1280 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1280 RNA, herein designated VGAM RNA, and which when bound by VGAM1280 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1280 host target proteins.

[17884] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1280 gene, herein designated VGAM GENE, on one or more VGAM1280 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17885] It is yet further appreciated that a function of VGAM1280 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1280 include diagnosis, prevention and treatment of viral infection by Human enterovirus C. Specific functions, and accordingly utilities, of VGAM1280 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1280 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17886] Nucleotide sequences of the VGAM1280 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1280 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1280 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1280 are further described hereinbelow with reference to Table 1.

[17887] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1280 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17888] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1281 (VGAM1281) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17889] VGAM1281 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1281 was detected is described hereinabove with reference to Figs. 2-8.

[17890] VGAM1281 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet virus Q. VGAM1281 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17891] VGAM1281 gene, herein designated VGAM GENE, encodes a VGAM1281 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1281 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1281 precursor RNA is designated SEQ ID:1267, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1267 is located at position 1984 relative to the genome of Beet virus Q.

[17892] VGAM1281 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1281 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17893] An enzyme complex designated DICER COMPLEX, dices the VGAM1281 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1281 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1281 RNA is designated SEQ ID:3992, and is provided hereinbelow with reference to the sequence listing part.

[17894] VGAM1281 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1281 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1281 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17895] VGAM1281 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1281 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1281 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1281 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1281 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17896] The complementary binding of VGAM1281 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1281 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1281 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1281 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17897] It is appreciated that VGAM1281 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1281 host target genes. The mRNA of each one of this plurality of VGAM1281 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1281 RNA, herein designated VGAM RNA, and which when bound by VGAM1281 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1281 host target proteins.

[17898] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1281 gene, herein designated VGAM GENE, on one or more VGAM1281 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17899] It is yet further appreciated that a function of VGAM1281 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1281 include diagnosis, prevention and treatment of viral infection by Beet virus Q. Specific functions, and accordingly utilities, of VGAM1281 correlate with, and may be deduced from, the identity of the host

target genes which VGAM1281 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17900] Nucleotide sequences of the VGAM1281 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1281 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1281 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1281 are further described hereinbelow with reference to Table 1.

[17901] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1281 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17902] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1282 (VGAM1282) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17903] VGAM1282 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1282 was detected is described hereinabove with reference to Figs. 2-8.

[17904] VGAM1282 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet virus Q. VGAM1282 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17905] VGAM1282 gene, herein designated VGAM GENE, encodes a VGAM1282 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1282 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1282 precursor RNA is designated SEQ ID:1268, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1268 is located at position 3568 relative to the genome of Beet virus Q.

[17906] VGAM1282 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1282 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17907] An enzyme complex designated DICER COMPLEX, dices the VGAM1282 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1282 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM1282 RNA is designated SEQ ID:3993, and is provided hereinbelow with reference to the sequence listing part.

[17908] VGAM1282 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1282 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1282 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17909] VGAM1282 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1282 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1282 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1282 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1282 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17910] The complementary binding of VGAM1282 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1282 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1282 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1282 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17911] It is appreciated that VGAM1282 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1282 host target genes. The mRNA of each one of this plurality of VGAM1282 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1282 RNA, herein designated VGAM RNA, and which when bound by VGAM1282 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1282 host target proteins.

[17912] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1282 gene, herein designated VGAM GENE, on one or more VGAM1282 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17913] It is yet further appreciated that a function of VGAM1282 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1282 include diagnosis, prevention and treatment of viral infection by Beet virus Q. Specific functions, and accordingly utilities, of VGAM1282 correlate with, and may be deduced from, the identity of the host

target genes which VGAM1282 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17914] Nucleotide sequences of the VGAM1282 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1282 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1282 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1282 are further described hereinbelow with reference to Table 1.

[17915] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1282 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17916] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1283 (VGAM1283) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17917] VGAM1283 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1283 was detected is described hereinabove with reference to Figs. 2–8.

[17918] VGAM1283 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet virus Q. VGAM1283 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17919] VGAM1283 gene, herein designated VGAM GENE, encodes a VGAM1283 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1283 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1283 precursor RNA is designated SEQ ID:1269, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1269 is located at position 3671 relative to the genome of Beet virus Q.

[17920] VGAM1283 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1283 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17921] An enzyme complex designated DICER COMPLEX, dices the VGAM1283 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1283 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1283 RNA is designated SEQ ID:3994, and is provided hereinbelow with reference to the sequence listing part.

[17922] VGAM1283 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1283 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1283 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17923] VGAM1283 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1283 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1283 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1283 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17924] The complementary binding of VGAM1283 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1283 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1283 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1283 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17925] It is appreciated that VGAM1283 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1283 host target genes. The mRNA of each one of this plurality of VGAM1283 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1283 RNA, herein designated VGAM RNA, and which when bound by VGAM1283 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1283 host target proteins.

[17926] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1283 gene, herein designated VGAM GENE, on one or more VGAM1283 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17927] It is yet further appreciated that a function of VGAM1283 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of viral infection by Beet virus Q. Specific functions, and accordingly utilities, of VGAM1283 correlate with, and may be deduced from, the identity of the host

target genes which VGAM1283 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17928] Nucleotide sequences of the VGAM1283 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1283 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1283 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1283 are further described hereinbelow with reference to Table 1.

[17929] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1283 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17930] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1284 (VGAM1284) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17931] VGAM1284 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1284 was detected is described hereinabove with reference to Figs. 2-8.

[17932] VGAM1284 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human enterovirus A. VGAM1284 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17933] VGAM1284 gene, herein designated VGAM GENE, encodes a VGAM1284 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1284 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1284 precursor RNA is designated SEQ ID:1270, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1270 is located at position 4771 relative to the genome of Human enterovirus A.

[17934] VGAM1284 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1284 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17935] An enzyme complex designated DICER COMPLEX, dices the VGAM1284 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1284 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM1284 RNA is designated SEQ ID:3995, and is provided hereinbelow with reference to the sequence listing part.

[17936] VGAM1284 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1284 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1284 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17937] VGAM1284 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1284 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1284 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1284 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1284 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17938] The complementary binding of VGAM1284 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1284 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1284 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1284 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17939] It is appreciated that VGAM1284 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1284 host target genes. The mRNA of each one of this plurality of VGAM1284 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1284 RNA, herein designated VGAM RNA, and which when bound by VGAM1284 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1284 host target proteins.

[17940] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1284 gene, herein designated VGAM GENE, on one or more VGAM1284 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17941] It is yet further appreciated that a function of VGAM1284 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1284 include diagnosis, prevention and treatment of viral infection by Human enterovirus A. Specific functions, and accordingly utilities, of VGAM1284

correlate with, and may be deduced from, the identity of the host target genes which VGAM1284 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17942] Nucleotide sequences of the VGAM1284 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1284 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1284 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1284 are further described hereinbelow with reference to Table 1.

[17943] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1284 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17944] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1285 (VGAM1285) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[17945] VGAM1285 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1285 was detected is described hereinabove with reference to Figs. 2–8.

[17946] VGAM1285 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet virus Q. VGAM1285 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17947] VGAM1285 gene, herein designated VGAM GENE, encodes a VGAM1285 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1285 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1285 precursor RNA is designated SEQ ID:1271, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1271 is located at position 460 relative to the genome of Beet virus Q.

[17948] VGAM1285 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1285 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17949] An enzyme complex designated DICER COMPLEX, dices the VGAM1285 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1285 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1285 RNA is designated SEQ ID:3996, and is provided hereinbelow with reference to the sequence listing part.

[17950] VGAM1285 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1285 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1285 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17951] VGAM1285 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1285 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1285 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1285 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1285 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17952] The complementary binding of VGAM1285 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1285 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1285 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1285 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17953] It is appreciated that VGAM1285 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1285 host target genes. The mRNA of each one of this plurality of VGAM1285 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1285 RNA, herein designated VGAM RNA, and which when bound by VGAM1285 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1285 host target proteins.

[17954] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1285 gene, herein designated VGAM GENE, on one or more VGAM1285 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17955] It is yet further appreciated that a function of VGAM1285 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1285 include diagnosis, prevention and treatment of viral infection by Beet virus Q. Specific functions, and accordingly utilities, of VGAM1285 correlate

with, and may be deduced from, the identity of the host target genes which VGAM1285 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17956] Nucleotide sequences of the VGAM1285 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1285 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1285 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1285 are further described hereinbelow with reference to Table 1.

[17957] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1285 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17958] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1286 (VGAM1286) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[17959] VGAM1286 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1286 was detected is described hereinabove with reference to Figs. 2–8.

[17960] VGAM1286 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human enterovirus A. VGAM1286 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17961] VGAM1286 gene, herein designated VGAM GENE, encodes a VGAM1286 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1286 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1286 precursor RNA is designated SEQ ID:1272, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1272 is located at position 1767 relative to the genome of Human enterovirus A.

[17962] VGAM1286 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1286 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17963] An enzyme complex designated DICER COMPLEX, dices the VGAM1286 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1286 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM1286 RNA is designated SEQ ID:3997, and is provided hereinbelow with reference to the sequence listing part.

[17964] VGAM1286 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1286 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1286 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17965] VGAM1286 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1286 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1286 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1286 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1286 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17966] The complementary binding of VGAM1286 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1286 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1286 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1286 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17967] It is appreciated that VGAM1286 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1286 host target genes. The mRNA of each one of this plurality of VGAM1286 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1286 RNA, herein designated VGAM RNA, and which when bound by VGAM1286 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1286 host target proteins.

[17968] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1286 gene, herein designated VGAM GENE, on one or more VGAM1286 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17969] It is yet further appreciated that a function of VGAM1286 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1286 include diagnosis, prevention and treatment of viral infection by Human enterovirus A. Spe-

cific functions, and accordingly utilities, of VGAM1286 correlate with, and may be deduced from, the identity of the host target genes which VGAM1286 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17970] Nucleotide sequences of the VGAM1286 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM1286 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1286 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1286 are further described hereinbelow with reference to Table 1.

[17971] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1286 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17972] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1287 (VGAM1287) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[17973] VGAM1287 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1287 was detected is described hereinabove with reference to Figs. 2–8.

[17974] VGAM1287 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet virus Q. VGAM1287 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17975] VGAM1287 gene, herein designated VGAM GENE, encodes a VGAM1287 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1287 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1287 precursor RNA is designated SEQ ID:1273, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1273 is located at position 1305 relative to the genome of Beet virus Q.

[17976] VGAM1287 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1287 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17977] An enzyme complex designated DICER COMPLEX, dices the VGAM1287 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1287 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1287 RNA is designated SEQ ID:3998, and is provided hereinbelow with reference to the sequence listing part.

[17978] VGAM1287 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1287 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1287 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17979] VGAM1287 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1287 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1287 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1287 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1287 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17980] The complementary binding of VGAM1287 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1287 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1287 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1287 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17981] It is appreciated that VGAM1287 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1287 host target genes. The mRNA of each one of this plurality of VGAM1287 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1287 RNA, herein designated VGAM RNA, and which when bound by VGAM1287 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1287 host target proteins.

[17982] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1287 gene, herein designated VGAM GENE, on one or more VGAM1287 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17983] It is yet further appreciated that a function of VGAM1287 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1287 include diagnosis, prevention and treatment of viral infection by Beet virus Q. Specific func-

tions, and accordingly utilities, of VGAM1287 correlate with, and may be deduced from, the identity of the host target genes which VGAM1287 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17984] Nucleotide sequences of the VGAM1287 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1287 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1287 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1287 are further described hereinbelow with reference to Table 1.

[17985] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1287 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17986] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1288 (VGAM1288) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[17987] VGAM1288 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1288 was detected is described hereinabove with reference to Figs. 2–8.

[17988] VGAM1288 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine herpesvirus 2. VGAM1288 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17989] VGAM1288 gene, herein designated VGAM GENE, encodes a VGAM1288 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1288 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1288 precursor RNA is designated SEQ ID:1274, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1274 is located at position 9116 relative to the genome of Saimiriine herpesvirus 2.

[17990] VGAM1288 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1288 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17991] An enzyme complex designated DICER COMPLEX, dices the VGAM1288 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1288 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM1288 RNA is designated SEQ ID:3999, and is provided hereinbelow with reference to the sequence listing part.

[17992] VGAM1288 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1288 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1288 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[17993] VGAM1288 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1288 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1288 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1288 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1288 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[17994] The complementary binding of VGAM1288 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1288 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1288 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1288 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17995] It is appreciated that VGAM1288 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1288 host target genes. The mRNA of each one of this plurality of VGAM1288 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1288 RNA, herein designated VGAM RNA, and which when bound by VGAM1288 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1288 host target proteins.

[17996] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1288 gene, herein designated VGAM GENE, on one or more VGAM1288 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[17997] It is yet further appreciated that a function of VGAM1288 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1288 include diagnosis, prevention and

treatment of viral infection by Saimiriine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1288 correlate with, and may be deduced from, the identity of the host target genes which VGAM1288 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17998] Nucleotide sequences of the VGAM1288 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1288 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1288 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1288 are further described hereinbelow with reference to Table 1.

[17999] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1288 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18000] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1289 (VGAM1289) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18001] VGAM1289 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1289 was detected is described hereinabove with reference to Figs. 2–8.

[18002] VGAM1289 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine herpesvirus 2. VGAM1289 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18003] VGAM1289 gene, herein designated VGAM GENE, encodes a VGAM1289 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1289 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1289 precursor RNA is designated SEQ ID:1275, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1275 is located at position 9692 relative to the genome of Saimiriine herpesvirus 2.

[18004] VGAM1289 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1289 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18005] An enzyme complex designated DICER COMPLEX, dices the VGAM1289 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1289 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1289 RNA is designated SEQ ID:4000, and is provided hereinbelow with reference to the sequence listing part.

[18006] VGAM1289 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1289 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1289 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18007] VGAM1289 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1289 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1289 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1289 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1289 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18008] The complementary binding of VGAM1289 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1289 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1289 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1289 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18009] It is appreciated that VGAM1289 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1289 host target genes. The mRNA of each one of this plurality of VGAM1289 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1289 RNA, herein designated VGAM

RNA, and which when bound by VGAM1289 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1289 host target proteins.

[18010] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1289 gene, herein designated VGAM GENE, on one or more VGAM1289 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18011] It is yet further appreciated that a function of VGAM1289 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1289 include diagnosis, prevention and treatment of viral infection by Saimiriine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1289 correlate with, and may be deduced from, the identity of the host target genes which VGAM1289 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18012] Nucleotide sequences of the VGAM1289 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1289 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1289 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1289 are further described hereinbelow with reference to Table 1.

[18013] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1289 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18014] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1290 (VGAM1290) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18015] VGAM1290 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1290 was detected is described hereinabove with reference to Figs. 2-8.

[18016] VGAM1290 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Grapevine fleck virus. VGAM1290 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18017] VGAM1290 gene, herein designated VGAM GENE, encodes a VGAM1290 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1290 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1290 precursor RNA is designated SEQ ID:1276, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1276 is located at position 5505

relative to the genome of Grapevine fleck virus.

[18018] VGAM1290 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1290 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18019] An enzyme complex designated DICER COMPLEX, dices the VGAM1290 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1290 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM1290 RNA is designated SEQ ID:4001, and is provided hereinbelow with reference to the sequence listing part.

[18020] VGAM1290 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1290 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1290 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18021] VGAM1290 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1290 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1290 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1290 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1290 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18022] The complementary binding of VGAM1290 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1290 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1290 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1290 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18023] It is appreciated that VGAM1290 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1290 host target genes. The mRNA of each one of this plurality of VGAM1290 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1290 RNA, herein designated VGAM RNA, and which when bound by VGAM1290 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1290 host target proteins.

[18024] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1290 gene, herein designated VGAM GENE, on one or more VGAM1290 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18025] It is yet further appreciated that a function of VGAM1290 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1290 include diagnosis, prevention and treatment of viral infection by Grapevine fleck virus. Specific functions, and accordingly utilities, of VGAM1290 correlate with, and may be deduced from, the identity of the host target genes which VGAM1290 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18026] Nucleotide sequences of the VGAM1290 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1290 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1290 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1290 are further described hereinbelow with reference to Table 1.

[18027] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1290 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18028] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1291 (VGAM1291) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18029] VGAM1291 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1291 was detected is described hereinabove with reference to Figs. 2–8.

[18030] VGAM1291 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Swinepox virus. VGAM1291 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18031] VGAM1291 gene, herein designated VGAM GENE, encodes a VGAM1291 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1291 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1291 precursor RNA is designated SEQ ID:1277, and is provided hereinbelow with reference to the sequence listing part. Nu–

cleotide sequence SEQ ID:1277 is located at position 74471 relative to the genome of Swinepox virus.

[18032] VGAM1291 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1291 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18033] An enzyme complex designated DICER COMPLEX, dices the VGAM1291 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1291 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1291 RNA is designated SEQ ID:4002, and is provided hereinbelow with reference to the sequence

listing part.

[18034] VGAM1291 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1291 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1291 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18035] VGAM1291 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1291 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1291 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1291 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1291 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18036] The complementary binding of VGAM1291 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1291 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1291 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1291 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18037] It is appreciated that VGAM1291 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1291 host target genes. The mRNA of each one of this plurality of VGAM1291 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1291 RNA, herein designated VGAM RNA, and which when bound by VGAM1291 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1291 host target proteins.

[18038] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1291 gene, herein designated VGAM GENE, on one or more VGAM1291 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18039] It is yet further appreciated that a function of VGAM1291

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1291 include diagnosis, prevention and treatment of viral infection by Swinepox virus. Specific functions, and accordingly utilities, of VGAM1291 correlate with, and may be deduced from, the identity of the host target genes which VGAM1291 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18040] Nucleotide sequences of the VGAM1291 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1291 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1291 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1291 are further described hereinbelow with reference to Table 1.

[18041] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1291 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18042] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1292 (VGAM1292) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18043] VGAM1292 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1292 was detected is described hereinabove with reference to Figs. 2–8.

[18044] VGAM1292 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Swinepox virus. VGAM1292 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18045] VGAM1292 gene, herein designated VGAM GENE, encodes a VGAM1292 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1292 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1292 precursor RNA is designated SEQ ID:1278, and is provided here–

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1278 is located at position 74650 relative to the genome of Swinepox virus.

[18046] VGAM1292 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1292 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18047] An enzyme complex designated DICER COMPLEX, dices the VGAM1292 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1292 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1292 RNA is designated SEQ ID:4003, and

is provided hereinbelow with reference to the sequence listing part.

[18048] VGAM1292 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1292 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1292 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18049] VGAM1292 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1292 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1292 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1292 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1292 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18050] The complementary binding of VGAM1292 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1292 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1292 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1292 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18051] It is appreciated that VGAM1292 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1292 host target genes. The mRNA of each one of this plurality of VGAM1292 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1292 RNA, herein designated VGAM RNA, and which when bound by VGAM1292 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1292 host target proteins.

[18052] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1292 gene, herein designated VGAM GENE, on one or more VGAM1292 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18053] It is yet further appreciated that a function of VGAM1292 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1292 include diagnosis, prevention and treatment of viral infection by Swinepox virus. Specific functions, and accordingly utilities, of VGAM1292 correlate with, and may be deduced from, the identity of the host target genes which VGAM1292 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18054] Nucleotide sequences of the VGAM1292 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM1292 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1292 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1292 are further described hereinbelow with reference to Table 1.

[18055] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1292 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18056] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1293 (VGAM1293) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18057] VGAM1293 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1293 was detected is described hereinabove with reference to Figs. 2–8.

[18058] VGAM1293 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Swinepox virus. VGAM1293 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18059] VGAM1293 gene, herein designated VGAM GENE, encodes a VGAM1293 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1293 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1293 precu-

sor RNA is designated SEQ ID:1279, and is provided herein below with reference to the sequence listing part. Nucleotide sequence SEQ ID:1279 is located at position 75881 relative to the genome of Swinepox virus.

[18060] VGAM1293 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1293 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18061] An enzyme complex designated DICER COMPLEX, dices the VGAM1293 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1293 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide se-

quence of VGAM1293 RNA is designated SEQ ID:4004, and is provided hereinbelow with reference to the sequence listing part.

[18062] VGAM1293 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1293 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1293 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18063] VGAM1293 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1293 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1293 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1293 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1293 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18064] The complementary binding of VGAM1293 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1293 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1293 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1293 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18065] It is appreciated that VGAM1293 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1293 host target genes. The mRNA of

each one of this plurality of VGAM1293 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1293 RNA, herein designated VGAM RNA, and which when bound by VGAM1293 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1293 host target proteins.

[18066] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1293 gene, herein designated VGAM GENE, on one or more VGAM1293 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[18067] It is yet further appreciated that a function of VGAM1293 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1293 include diagnosis, prevention and treatment of viral infection by Swinepox virus. Specific functions, and accordingly utilities, of VGAM1293 correlate with, and may be deduced from, the identity of the host target genes which VGAM1293 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18068] Nucleotide sequences of the VGAM1293 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1293 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1293 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1293 are further described hereinbelow with reference to Table 1.

[18069] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1293 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[18070] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1294 (VGAM1294) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18071] VGAM1294 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1294 was detected is described hereinabove with reference to Figs. 2–8.

[18072] VGAM1294 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus. VGAM1294 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18073] VGAM1294 gene, herein designated VGAM GENE, encodes a VGAM1294 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1294 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1294 precursor RNA is designated SEQ ID:1280, and is provided herein below with reference to the sequence listing part. Nucleotide sequence SEQ ID:1280 is located at position 8120 relative to the genome of Vaccinia virus.

[18074] VGAM1294 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1294 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18075] An enzyme complex designated DICER COMPLEX, dices the VGAM1294 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1294 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1294 RNA is designated SEQ ID:4005, and is provided hereinbelow with reference to the sequence listing part.

[18076] VGAM1294 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1294 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1294 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18077] VGAM1294 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1294 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1294 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1294 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1294 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18078] The complementary binding of VGAM1294 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1294 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1294 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1294 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18079] It is appreciated that VGAM1294 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1294 host target genes. The mRNA of each one of this plurality of VGAM1294 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1294 RNA, herein designated VGAM RNA, and which when bound by VGAM1294 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1294 host target proteins.

[18080] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1294 gene, herein designated VGAM GENE, on one or more VGAM1294 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[18081] It is yet further appreciated that a function of VGAM1294 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1294 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM1294 correlate with, and may be deduced from, the identity of the host target genes which VGAM1294 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18082] Nucleotide sequences of the VGAM1294 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1294 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1294 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1294 are further described hereinbelow with reference to Table 1.

[18083] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1294 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18084] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1295 (VGAM1295) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18085] VGAM1295 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1295 was detected is described hereinabove with reference to Figs. 2-8.

[18086] VGAM1295 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus.

VGAM1295 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18087] VGAM1295 gene, herein designated VGAM GENE, encodes a VGAM1295 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1295 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1295 precursor RNA is designated SEQ ID:1281, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1281 is located at position 10613 relative to the genome of Vaccinia virus.

[18088] VGAM1295 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1295 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18089] An enzyme complex designated DICER COMPLEX, dices the VGAM1295 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1295 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1295 RNA is designated SEQ ID:4006, and is provided hereinbelow with reference to the sequence listing part.

[18090] VGAM1295 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1295 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1295 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18091] VGAM1295 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1295 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1295 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1295 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1295 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18092] The complementary binding of VGAM1295 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1295 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1295 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1295 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18093] It is appreciated that VGAM1295 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1295 host target genes. The mRNA of each one of this plurality of VGAM1295 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1295 RNA, herein designated VGAM RNA, and which when bound by VGAM1295 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1295 host target proteins.

[18094] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1295 gene, herein designated VGAM GENE, on one or more VGAM1295 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18095] It is yet further appreciated that a function of VGAM1295 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1295 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM1295 correlate with, and may be deduced from, the identity of the host target genes which VGAM1295 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18096] Nucleotide sequences of the VGAM1295 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1295 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1295 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1295 are further described hereinbelow with reference to Table 1.

[18097] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1295 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18098] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1296 (VGAM1296) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18099] VGAM1296 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1296 was detected is described hereinabove with reference to Figs. 2–8.

[18100] VGAM1296 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus.

VGAM1296 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18101] VGAM1296 gene, herein designated VGAM GENE, encodes a VGAM1296 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1296 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1296 precursor RNA is designated SEQ ID:1282, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1282 is located at position 11590 relative to the genome of Vaccinia virus.

[18102] VGAM1296 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1296 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18103] An enzyme complex designated DICER COMPLEX, dices the VGAM1296 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1296 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM1296 RNA is designated SEQ ID:4007, and is provided hereinbelow with reference to the sequence listing part.

[18104] VGAM1296 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1296 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1296 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18105] VGAM1296 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1296 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1296 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1296 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1296 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18106] The complementary binding of VGAM1296 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1296 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1296 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1296 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18107] It is appreciated that VGAM1296 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1296 host target genes. The mRNA of each one of this plurality of VGAM1296 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1296 RNA, herein designated VGAM RNA, and which when bound by VGAM1296 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1296 host target proteins.

[18108] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1296 gene, herein designated VGAM GENE, on one or more VGAM1296 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18109] It is yet further appreciated that a function of VGAM1296 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1296 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM1296 correlate with, and may be deduced from, the identity of the host target genes which VGAM1296 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18110] Nucleotide sequences of the VGAM1296 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1296 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1296 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1296 are further described hereinbelow with reference to Table 1.

[18111] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1296 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18112] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1297 (VGAM1297) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18113] VGAM1297 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1297 was detected is described hereinabove with reference to Figs. 2-8.

[18114] VGAM1297 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like disease virus. VGAM1297 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18115] VGAM1297 gene, herein designated VGAM GENE, encodes a VGAM1297 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1297 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1297 precursor RNA is designated SEQ ID:1283, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1283 is located at position 75507 relative to the genome of Yaba-like disease virus.

[18116] VGAM1297 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1297 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18117] An enzyme complex designated DICER COMPLEX, dices the VGAM1297 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1297 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM1297 RNA is designated SEQ ID:4008, and is provided hereinbelow with reference to the sequence listing part.

[18118] VGAM1297 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1297 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1297 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18119] VGAM1297 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1297 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1297 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1297 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1297 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18120] The complementary binding of VGAM1297 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1297 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1297 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1297 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[18121] It is appreciated that VGAM1297 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1297 host target genes. The mRNA of each one of this plurality of VGAM1297 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1297 RNA, herein designated VGAM RNA, and which when bound by VGAM1297 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1297 host target proteins.

[18122] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1297 gene, herein designated VGAM GENE, on one or more VGAM1297 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18123] It is yet further appreciated that a function of VGAM1297 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1297 include diagnosis, prevention and treatment of viral infection by Yaba-like disease virus. Specific functions, and accordingly utilities, of VGAM1297 correlate with, and may be deduced from, the identity of the host target genes which VGAM1297 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18124] Nucleotide sequences of the VGAM1297 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1297 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1297 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1297 are further described hereinbelow with reference to Table 1.

[18125] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1297 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18126] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1298 (VGAM1298) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18127] VGAM1298 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1298 was detected is described hereinabove with reference to Figs. 2-8.

[18128] VGAM1298 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like disease virus. VGAM1298 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18129] VGAM1298 gene, herein designated VGAM GENE, encodes a VGAM1298 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1298 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1298 precursor RNA is designated SEQ ID:1284, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1284 is located at position 77434 relative to the genome of Yaba-like disease virus.

[18130] VGAM1298 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1298 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18131] An enzyme complex designated DICER COMPLEX, dices the VGAM1298 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1298 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1298 RNA is designated SEQ ID:4009, and is provided hereinbelow with reference to the sequence listing part.

[18132] VGAM1298 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1298 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1298 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18133] VGAM1298 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1298 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1298 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1298 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1298 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18134] The complementary binding of VGAM1298 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1298 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1298 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1298 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18135] It is appreciated that VGAM1298 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1298 host target genes. The mRNA of each one of this plurality of VGAM1298 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1298 RNA, herein designated VGAM RNA, and which when bound by VGAM1298 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1298 host target proteins.

[18136] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1298 gene, herein designated VGAM GENE, on one or more VGAM1298 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18137] It is yet further appreciated that a function of VGAM1298 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1298 include diagnosis, prevention and treatment of viral infection by Yaba-like disease virus. Specific functions, and accordingly utilities, of VGAM1298 correlate with, and may be deduced from, the identity of the host target genes which VGAM1298 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18138] Nucleotide sequences of the VGAM1298 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1298 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1298 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1298 are further described hereinbelow with reference to Table 1.

[18139] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1298 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18140] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1299 (VGAM1299) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18141] VGAM1299 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1299 was detected is described hereinabove with reference to Figs. 2-8.

[18142] VGAM1299 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like disease virus. VGAM1299 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18143] VGAM1299 gene, herein designated VGAM GENE, encodes

a VGAM1299 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1299 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1299 precursor RNA is designated SEQ ID:1285, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1285 is located at position 80251 relative to the genome of Yaba-like disease virus.

[18144] VGAM1299 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1299 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18145] An enzyme complex designated DICER COMPLEX, dices the VGAM1299 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1299 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1299 RNA is designated SEQ ID:4010, and is provided hereinbelow with reference to the sequence listing part.

[18146] VGAM1299 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1299 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1299 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18147] VGAM1299 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1299 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1299 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1299 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1299 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18148] The complementary binding of VGAM1299 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1299 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1299 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1299 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18149] It is appreciated that VGAM1299 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1299 host target genes. The mRNA of each one of this plurality of VGAM1299 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1299 RNA, herein designated VGAM RNA, and which when bound by VGAM1299 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1299 host target proteins.

[18150] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1299 gene, herein designated VGAM GENE, on one or more VGAM1299 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18151] It is yet further appreciated that a function of VGAM1299 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1299 include diagnosis, prevention and treatment of viral infection by Yaba-like disease virus. Specific functions, and accordingly utilities, of VGAM1299 correlate with, and may be deduced from, the identity of the host target genes which VGAM1299 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18152] Nucleotide sequences of the VGAM1299 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1299 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1299 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1299 are further

described hereinbelow with reference to Table 1.

[18153] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1299 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18154] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1300 (VGAM1300) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18155] VGAM1300 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1300 was detected is described hereinabove with reference to Figs. 2-8.

[18156] VGAM1300 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like disease virus. VGAM1300 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18157] VGAM1300 gene, herein designated VGAM GENE, encodes a VGAM1300 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1300 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1300 precursor RNA is designated SEQ ID:1286, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1286 is located at position 78499 relative to the genome of Yaba-like disease virus.

[18158] VGAM1300 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1300 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18159] An enzyme complex designated DICER COMPLEX, dices the VGAM1300 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1300 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1300 RNA is designated SEQ ID:4011, and is provided hereinbelow with reference to the sequence listing part.

[18160] VGAM1300 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1300 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1300 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18161] VGAM1300 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1300 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1300 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1300 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1300 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18162] The complementary binding of VGAM1300 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1300 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1300

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1300 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18163] It is appreciated that VGAM1300 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1300 host target genes. The mRNA of each one of this plurality of VGAM1300 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1300 RNA, herein designated VGAM RNA, and which when bound by VGAM1300 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1300 host target proteins.

[18164] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1300 gene, herein designated VGAM GENE, on one or more VGAM1300 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18165] It is yet further appreciated that a function of VGAM1300 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1300 include diagnosis, prevention and treatment of viral infection by Yaba-like disease virus. Specific functions, and accordingly utilities, of VGAM1300 correlate with, and may be deduced from, the identity of the host target genes which VGAM1300 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18166] Nucleotide sequences of the VGAM1300 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1300 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1300 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1300 are further described hereinbelow with reference to Table 1.

[18167] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1300 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18168] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1301 (VGAM1301) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18169] VGAM1301 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1301 was detected is described hereinabove with reference to Figs. 2-8.

[18170] VGAM1301 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like disease virus. VGAM1301 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[18171] VGAM1301 gene, herein designated VGAM GENE, encodes a VGAM1301 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1301 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1301 precursor RNA is designated SEQ ID:1287, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1287 is located at position 78643 relative to the genome of Yaba-like disease virus.

[18172] VGAM1301 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1301 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18173] An enzyme complex designated DICER COMPLEX, dices

the VGAM1301 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1301 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 60%) nucleotide sequence of VGAM1301 RNA is designated SEQ ID:4012, and is provided hereinbelow with reference to the sequence listing part.

[18174] VGAM1301 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1301 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1301 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18175] VGAM1301 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1301 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1301 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1301 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1301 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18176] The complementary binding of VGAM1301 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1301 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1301 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1301 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18177] It is appreciated that VGAM1301 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1301 host target genes. The mRNA of each one of this plurality of VGAM1301 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1301 RNA, herein designated VGAM RNA, and which when bound by VGAM1301 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1301 host target proteins.

[18178] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1301 gene, herein designated VGAM GENE, on one or more VGAM1301 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18179] It is yet further appreciated that a function of VGAM1301 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1301 include diagnosis, prevention and treatment of viral infection by Yaba-like disease virus. Specific functions, and accordingly utilities, of VGAM1301 correlate with, and may be deduced from, the identity of the host target genes which VGAM1301 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18180] Nucleotide sequences of the VGAM1301 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1301 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1301 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1301 are further described hereinbelow with reference to Table 1.

[18181] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1301 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18182] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1302 (VGAM1302) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18183] VGAM1302 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1302 was detected is described hereinabove with reference to Figs. 2-8.

[18184] VGAM1302 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM1302 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

- [18185] VGAM1302 gene, herein designated VGAM GENE, encodes a VGAM1302 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1302 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1302 precursor RNA is designated SEQ ID:1288, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1288 is located at position 180181 relative to the genome of Human herpesvirus 5.
- [18186] VGAM1302 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1302 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18187] An enzyme complex designated DICER COMPLEX, dices the VGAM1302 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1302 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1302 RNA is designated SEQ ID:4013, and is provided hereinbelow with reference to the sequence listing part.

[18188] VGAM1302 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1302 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1302 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18189] VGAM1302 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1302 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1302 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1302 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1302 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18190] The complementary binding of VGAM1302 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1302 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1302 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1302 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18191] It is appreciated that VGAM1302 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1302 host target genes. The mRNA of each one of this plurality of VGAM1302 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1302 RNA, herein designated VGAM RNA, and which when bound by VGAM1302 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1302 host target proteins.

[18192] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1302 gene, herein designated VGAM GENE, on one or more VGAM1302 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18193] It is yet further appreciated that a function of VGAM1302 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1302 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM1302 correlate with, and may be deduced from, the identity of the host target genes which VGAM1302 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18194] Nucleotide sequences of the VGAM1302 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1302 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1302 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1302 are further described hereinbelow with reference to Table 1.

[18195] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1302 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18196] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1303 (VGAM1303) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18197] VGAM1303 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1303 was detected is described hereinabove with reference to Figs. 2-8.

[18198] VGAM1303 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5.

VGAM1303 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18199] VGAM1303 gene, herein designated VGAM GENE, encodes a VGAM1303 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1303 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1303 precursor RNA is designated SEQ ID:1289, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1289 is located at position 177616 relative to the genome of Human herpesvirus 5.

[18200] VGAM1303 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1303 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[18201] An enzyme complex designated DICER COMPLEX, dices the VGAM1303 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1303 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1303 RNA is designated SEQ ID:4014, and is provided hereinbelow with reference to the sequence listing part.

[18202] VGAM1303 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1303 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1303 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18203] VGAM1303 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1303 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1303 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1303 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1303 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18204] The complementary binding of VGAM1303 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1303 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1303 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1303 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18205] It is appreciated that VGAM1303 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1303 host target genes. The mRNA of each one of this plurality of VGAM1303 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1303 RNA, herein designated VGAM RNA, and which when bound by VGAM1303 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1303 host target proteins.

[18206] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1303 gene, herein designated VGAM GENE, on one or more VGAM1303 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18207] It is yet further appreciated that a function of VGAM1303 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1303 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM1303 correlate with, and may be deduced from, the identity of the host target genes which VGAM1303 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18208] Nucleotide sequences of the VGAM1303 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1303 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1303 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1303 are further described hereinbelow with reference to Table 1.

[18209] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1303 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18210] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1304 (VGAM1304) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18211] VGAM1304 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1304 was detected is described hereinabove with reference to Figs. 2-8.

[18212] VGAM1304 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Human herpesvirus 5. VGAM1304 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18213] VGAM1304 gene, herein designated VGAM GENE, encodes a VGAM1304 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1304 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1304 precursor RNA is designated SEQ ID:1290, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1290 is located at position 179588 relative to the genome of Human herpesvirus 5.

[18214] VGAM1304 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1304 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18215] An enzyme complex designated DICER COMPLEX, dices the VGAM1304 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1304 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1304 RNA is designated SEQ ID:4015, and is provided hereinbelow with reference to the sequence listing part.

[18216] VGAM1304 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1304 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1304 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18217] VGAM1304 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1304 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1304 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1304 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1304 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18218] The complementary binding of VGAM1304 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1304 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1304 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1304 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18219] It is appreciated that VGAM1304 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1304 host target genes. The mRNA of each one of this plurality of VGAM1304 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1304 RNA, herein designated VGAM RNA, and which when bound by VGAM1304 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1304 host target proteins.

[18220] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1304 gene, herein designated VGAM GENE, on one or more VGAM1304 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18221] It is yet further appreciated that a function of VGAM1304 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1304 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM1304 correlate with, and may be deduced from, the identity of the host target genes which VGAM1304 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18222] Nucleotide sequences of the VGAM1304 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1304 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1304 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1304 are further described hereinbelow with reference to Table 1.

[18223] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1304 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18224] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1305 (VGAM1305) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18225] VGAM1305 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1305 was detected is described hereinabove with reference to Figs. 2-8.

[18226] VGAM1305 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Foot-and-mouth disease virus SAT 2 (FMDV-SAT2). VGAM1305 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18227] VGAM1305 gene, herein designated VGAM GENE, encodes a VGAM1305 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1305 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1305 precursor RNA is designated SEQ ID:1291, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1291 is located at position 409 relative to the genome of Foot-and-mouth disease virus SAT 2 (FMDV-SAT2).

[18228] VGAM1305 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1305 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18229] An enzyme complex designated DICER COMPLEX, dices the VGAM1305 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1305 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1305 RNA is designated SEQ ID:4016, and is provided hereinbelow with reference to the sequence listing part.

[18230] VGAM1305 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1305 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1305 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18231] VGAM1305 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1305 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1305 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1305 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1305 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[18232] The complementary binding of VGAM1305 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1305 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1305 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1305 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18233] It is appreciated that VGAM1305 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1305 host target genes. The mRNA of each one of this plurality of VGAM1305 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1305 RNA, herein designated VGAM RNA, and which when bound by VGAM1305 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1305 host target proteins.

[18234] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1305 gene, herein designated VGAM GENE, on one or more VGAM1305 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18235] It is yet further appreciated that a function of VGAM1305 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1305 include diagnosis, prevention and treatment of viral infection by Foot-and-mouth disease virus SAT 2 (FMDV-SAT2). Specific functions, and accordingly utilities, of VGAM1305 correlate with, and may be deduced from, the identity of the host target genes which VGAM1305 binds and inhibits, and the function of these

host target genes, as elaborated hereinbelow.

[18236] Nucleotide sequences of the VGAM1305 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1305 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1305 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1305 are further described hereinbelow with reference to Table 1.

[18237] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1305 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18238] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1306 (VGAM1306) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18239] VGAM1306 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1306 was detected is described hereinabove with reference to Figs. 2–8.

[18240] VGAM1306 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Foot-and-mouth disease virus SAT 2 (FMDV–SAT2). VGAM1306 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18241] VGAM1306 gene, herein designated VGAM GENE, encodes a VGAM1306 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1306 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1306 precursor RNA is designated SEQ ID:1292, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1292 is located at position 4577 relative to the genome of Foot-and-mouth disease virus SAT 2 (FMDV–SAT2).

[18242] VGAM1306 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1306 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18243] An enzyme complex designated DICER COMPLEX, dices the VGAM1306 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1306 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1306 RNA is designated SEQ ID:4017, and is provided hereinbelow with reference to the sequence listing part.

[18244] VGAM1306 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1306 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1306 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18245] VGAM1306 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1306 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1306 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1306 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1306 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18246] The complementary binding of VGAM1306 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1306 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1306 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1306 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18247] It is appreciated that VGAM1306 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1306 host target genes. The mRNA of each one of this plurality of VGAM1306 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1306 RNA, herein designated VGAM RNA, and which when bound by VGAM1306 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1306 host target proteins.

[18248] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1306 gene, herein designated VGAM GENE, on one or more VGAM1306 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18249] It is yet further appreciated that a function of VGAM1306 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1306 include diagnosis, prevention and treatment of viral infection by Foot-and-mouth disease virus SAT 2 (FMDV-SAT2). Specific functions, and accordingly utilities, of VGAM1306 correlate with, and may be

deduced from, the identity of the host target genes which VGAM1306 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18250] Nucleotide sequences of the VGAM1306 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1306 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1306 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1306 are further described hereinbelow with reference to Table 1.

[18251] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1306 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18252] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1307 (VGAM1307) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18253] VGAM1307 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1307 was detected is described hereinabove with reference to Figs. 2-8.

[18254] VGAM1307 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Foot-and-mouth disease virus SAT 2 (FMDV-SAT2). VGAM1307 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18255] VGAM1307 gene, herein designated VGAM GENE, encodes a VGAM1307 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1307 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1307 precursor RNA is designated SEQ ID:1293, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1293 is located at position 5733 relative to the genome of Foot-and-mouth disease virus SAT 2 (FMDV-SAT2).

[18256] VGAM1307 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1307 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18257] An enzyme complex designated DICER COMPLEX, dices the VGAM1307 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1307 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1307 RNA is designated SEQ ID:4018, and is provided hereinbelow with reference to the sequence listing part.

[18258] VGAM1307 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1307 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1307 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18259] VGAM1307 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1307 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1307 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1307 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1307 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18260] The complementary binding of VGAM1307 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1307 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1307 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1307 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18261] It is appreciated that VGAM1307 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1307 host target genes. The mRNA of each one of this plurality of VGAM1307 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1307 RNA, herein designated VGAM RNA, and which when bound by VGAM1307 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1307 host target proteins.

[18262] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1307 gene, herein designated VGAM GENE, on one or more VGAM1307 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18263] It is yet further appreciated that a function of VGAM1307 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1307 include diagnosis, prevention and treatment of viral infection by Foot-and-mouth disease

virus SAT 2 (FMDV-SAT2). Specific functions, and accordingly utilities, of VGAM1307 correlate with, and may be deduced from, the identity of the host target genes which VGAM1307 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18264] Nucleotide sequences of the VGAM1307 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1307 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1307 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1307 are further described hereinbelow with reference to Table 1.

[18265] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1307 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18266] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1308 (VGAM1308) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[18267] VGAM1308 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1308 was detected is described hereinabove with reference to Figs. 2–8.

[18268] VGAM1308 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Foot-and-mouth disease virus SAT 2 (FMDV–SAT2). VGAM1308 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18269] VGAM1308 gene, herein designated VGAM GENE, encodes a VGAM1308 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1308 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1308 precursor RNA is designated SEQ ID:1294, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1294 is located at position 4790 relative to the genome of Foot-and-mouth disease virus SAT 2 (FMDV–SAT2).

[18270] VGAM1308 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1308 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18271] An enzyme complex designated DICER COMPLEX, dices the VGAM1308 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1308 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1308 RNA is designated SEQ ID:4019, and is provided hereinbelow with reference to the sequence listing part.

[18272] VGAM1308 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1308 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1308 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18273] VGAM1308 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1308 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1308 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1308 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1308 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18274] The complementary binding of VGAM1308 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1308 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1308 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1308 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18275] It is appreciated that VGAM1308 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1308 host target genes. The mRNA of each one of this plurality of VGAM1308 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1308 RNA, herein designated VGAM

RNA, and which when bound by VGAM1308 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1308 host target proteins.

[18276] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1308 gene, herein designated VGAM GENE, on one or more VGAM1308 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18277] It is yet further appreciated that a function of VGAM1308 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1308 include diagnosis, prevention and treatment of viral infection by Foot-and-mouth disease virus SAT 2 (FMDV-SAT2). Specific functions, and accordingly utilities, of VGAM1308 correlate with, and may be deduced from, the identity of the host target genes which VGAM1308 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18278] Nucleotide sequences of the VGAM1308 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1308 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1308 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1308 are further described hereinbelow with reference to Table 1.

[18279] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1308 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18280] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1309 (VGAM1309) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18281] VGAM1309 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1309 was detected is described hereinabove with reference to Figs. 2-8.

[18282] VGAM1309 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus D. VGAM1309 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18283] VGAM1309 gene, herein designated VGAM GENE, encodes a VGAM1309 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1309 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1309 precursor RNA is designated SEQ ID:1295, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1295 is located at position

28090 relative to the genome of Human adenovirus D.

[18284] VGAM1309 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1309 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18285] An enzyme complex designated DICER COMPLEX, dices the VGAM1309 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1309 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1309 RNA is designated SEQ ID:4020, and is provided hereinbelow with reference to the sequence listing part.

[18286] VGAM1309 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1309 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1309 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18287] VGAM1309 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1309 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1309 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1309 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1309 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18288] The complementary binding of VGAM1309 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1309 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1309 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1309 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18289] It is appreciated that VGAM1309 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1309 host target genes. The mRNA of each one of this plurality of VGAM1309 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1309 RNA, herein designated VGAM RNA, and which when bound by VGAM1309 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1309 host target proteins.

[18290] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1309 gene, herein designated VGAM GENE, on one or more VGAM1309 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18291] It is yet further appreciated that a function of VGAM1309 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1309 include diagnosis, prevention and treatment of viral infection by Human adenovirus D. Specific functions, and accordingly utilities, of VGAM1309 correlate with, and may be deduced from, the identity of the host target genes which VGAM1309 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18292] Nucleotide sequences of the VGAM1309 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1309 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1309 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1309 are further described hereinbelow with reference to Table 1.

[18293] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1309 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18294] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1310 (VGAM1310) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18295] VGAM1310 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1310 was detected is described hereinabove with reference to Figs. 2–8.

[18296] VGAM1310 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus D. VGAM1310 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18297] VGAM1310 gene, herein designated VGAM GENE, encodes a VGAM1310 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1310 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1310 precursor RNA is designated SEQ ID:1296, and is provided hereinbelow with reference to the sequence listing part. Nu–

cleotide sequence SEQ ID:1296 is located at position 24460 relative to the genome of Human adenovirus D.

[18298] VGAM1310 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1310 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18299] An enzyme complex designated DICER COMPLEX, dices the VGAM1310 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1310 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM1310 RNA is designated SEQ ID:4021, and is provided hereinbelow with reference to the sequence

listing part.

[18300] VGAM1310 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1310 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1310 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18301] VGAM1310 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1310 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1310 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1310 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1310 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18302] The complementary binding of VGAM1310 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1310 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1310 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1310 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18303] It is appreciated that VGAM1310 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1310 host target genes. The mRNA of each one of this plurality of VGAM1310 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1310 RNA, herein designated VGAM RNA, and which when bound by VGAM1310 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1310 host target proteins.

[18304] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1310 gene, herein designated VGAM GENE, on one or more VGAM1310 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18305] It is yet further appreciated that a function of VGAM1310

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1310 include diagnosis, prevention and treatment of viral infection by Human adenovirus D. Specific functions, and accordingly utilities, of VGAM1310 correlate with, and may be deduced from, the identity of the host target genes which VGAM1310 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18306] Nucleotide sequences of the VGAM1310 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1310 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1310 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1310 are further described hereinbelow with reference to Table 1.

[18307] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1310 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18308] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1311 (VGAM1311) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18309] VGAM1311 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1311 was detected is described hereinabove with reference to Figs. 2–8.

[18310] VGAM1311 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Foot-and-mouth disease virus C. VGAM1311 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18311] VGAM1311 gene, herein designated VGAM GENE, encodes a VGAM1311 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1311 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1311 precursor RNA is designated SEQ ID:1297, and is provided here–

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1297 is located at position 3024 relative to the genome of Foot-and-mouth disease virus C.

[18312] VGAM1311 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1311 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18313] An enzyme complex designated DICER COMPLEX, dices the VGAM1311 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1311 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide se-

quence of VGAM1311 RNA is designated SEQ ID:4022, and is provided hereinbelow with reference to the sequence listing part.

[18314] VGAM1311 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1311 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1311 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18315] VGAM1311 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1311 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1311 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1311 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1311 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18316] The complementary binding of VGAM1311 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1311 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1311 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1311 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18317] It is appreciated that VGAM1311 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1311 host target genes. The mRNA of

each one of this plurality of VGAM1311 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1311 RNA, herein designated VGAM RNA, and which when bound by VGAM1311 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1311 host target proteins.

[18318] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1311 gene, herein designated VGAM GENE, on one or more VGAM1311 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[18319] It is yet further appreciated that a function of VGAM1311 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1311 include diagnosis, prevention and treatment of viral infection by Foot-and-mouth disease virus C. Specific functions, and accordingly utilities, of VGAM1311 correlate with, and may be deduced from, the identity of the host target genes which VGAM1311 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18320] Nucleotide sequences of the VGAM1311 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1311 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1311 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1311 are further described hereinbelow with reference to Table 1.

[18321] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1311 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[18322] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1312 (VGAM1312) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18323] VGAM1312 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1312 was detected is described hereinabove with reference to Figs. 2–8.

[18324] VGAM1312 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Foot-and-mouth disease virus C. VGAM1312 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18325] VGAM1312 gene, herein designated VGAM GENE, encodes a VGAM1312 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1312 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1312 precursor RNA is designated SEQ ID:1298, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1298 is located at position 1074 relative to the genome of Foot-and-mouth disease virus C.

[18326] VGAM1312 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1312 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18327] An enzyme complex designated DICER COMPLEX, dices the VGAM1312 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1312 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1312 RNA is designated SEQ ID:4023, and is provided hereinbelow with reference to the sequence listing part.

[18328] VGAM1312 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1312 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1312 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18329] VGAM1312 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1312 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1312 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1312 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1312 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18330] The complementary binding of VGAM1312 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1312 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1312 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1312 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18331] It is appreciated that VGAM1312 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1312 host target genes. The mRNA of each one of this plurality of VGAM1312 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1312 RNA, herein designated VGAM RNA, and which when bound by VGAM1312 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1312 host target proteins.

[18332] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1312 gene, herein designated VGAM GENE, on one or more VGAM1312 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18333] It is yet further appreciated that a function of VGAM1312 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1312 include diagnosis, prevention and treatment of viral infection by Foot-and-mouth disease virus C. Specific functions, and accordingly utilities, of VGAM1312 correlate with, and may be deduced from, the identity of the host target genes which VGAM1312 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18334] Nucleotide sequences of the VGAM1312 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1312 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1312 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1312 are further described hereinbelow with reference to Table 1.

[18335] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1312 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18336] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1313 (VGAM1313) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18337] VGAM1313 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1313 was detected is described hereinabove with reference to Figs. 2–8.

[18338] VGAM1313 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Foot-and-mouth disease virus C. VGAM1313 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18339] VGAM1313 gene, herein designated VGAM GENE, encodes a VGAM1313 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1313 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1313 precursor RNA is designated SEQ ID:1299, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1299 is located at position 4912 relative to the genome of Foot-and-mouth disease virus C.

[18340] VGAM1313 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1313 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18341] An enzyme complex designated DICER COMPLEX, dices the VGAM1313 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1313 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1313 RNA is designated SEQ ID:4024, and is provided hereinbelow with reference to the sequence listing part.

[18342] VGAM1313 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1313 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1313 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18343] VGAM1313 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1313 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1313 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1313 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1313 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18344] The complementary binding of VGAM1313 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1313 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1313 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1313 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[18345] It is appreciated that VGAM1313 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1313 host target genes. The mRNA of each one of this plurality of VGAM1313 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1313 RNA, herein designated VGAM RNA, and which when bound by VGAM1313 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1313 host target proteins.

[18346] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1313 gene, herein designated VGAM GENE, on one or more VGAM1313 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18347] It is yet further appreciated that a function of VGAM1313 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1313 include diagnosis, prevention and treatment of viral infection by Foot-and-mouth disease virus C. Specific functions, and accordingly utilities, of VGAM1313 correlate with, and may be deduced from, the identity of the host target genes which VGAM1313 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18348] Nucleotide sequences of the VGAM1313 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM1313 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1313 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1313 are further described hereinbelow with reference to Table 1.

[18349] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1313 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18350] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1314 (VGAM1314) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18351] VGAM1314 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1314 was detected is described hereinabove with reference to Figs. 2-8.

[18352] VGAM1314 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Foot-and-mouth disease virus C. VGAM1314 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18353] VGAM1314 gene, herein designated VGAM GENE, encodes a VGAM1314 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1314 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1314 precursor RNA is designated SEQ ID:1300, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1300 is located at position 4399 relative to the genome of Foot-and-mouth disease virus C.

[18354] VGAM1314 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1314 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18355] An enzyme complex designated DICER COMPLEX, dices the VGAM1314 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1314 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM1314 RNA is designated SEQ ID:4025, and is provided hereinbelow with reference to the sequence listing part.

[18356] VGAM1314 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1314 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1314 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18357] VGAM1314 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1314 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1314 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1314 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18358] The complementary binding of VGAM1314 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1314 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1314 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1314 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18359] It is appreciated that VGAM1314 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1314 host target genes. The mRNA of each one of this plurality of VGAM1314 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1314 RNA, herein designated VGAM RNA, and which when bound by VGAM1314 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1314 host target proteins.

[18360] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1314 gene, herein designated VGAM GENE, on one or more VGAM1314 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18361] It is yet further appreciated that a function of VGAM1314 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of viral infection by Foot-and-mouth disease virus C. Specific functions, and accordingly utilities, of VGAM1314 correlate with, and may be deduced from, the identity of the host target genes which VGAM1314 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18362] Nucleotide sequences of the VGAM1314 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1314 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1314 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1314 are further described hereinbelow with reference to Table 1.

[18363] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1314 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18364] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1315 (VGAM1315) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18365] VGAM1315 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1315 was detected is described hereinabove with reference to Figs. 2–8.

[18366] VGAM1315 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Foot-and-mouth disease virus C. VGAM1315 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18367] VGAM1315 gene, herein designated VGAM GENE, encodes a VGAM1315 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1315 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1315 precu-

sor RNA is designated SEQ ID:1301, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1301 is located at position 7067 relative to the genome of Foot-and-mouth disease virus C.

[18368] VGAM1315 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1315 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18369] An enzyme complex designated DICER COMPLEX, dices the VGAM1315 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1315 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 86%) nucleotide sequence of VGAM1315 RNA is designated SEQ ID:4026, and is provided hereinbelow with reference to the sequence listing part.

[18370] VGAM1315 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1315 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1315 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18371] VGAM1315 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1315 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1315 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1315 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18372] The complementary binding of VGAM1315 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1315 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1315 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1315 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18373] It is appreciated that VGAM1315 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1315 host target genes. The mRNA of each one of this plurality of VGAM1315 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1315 RNA, herein designated VGAM RNA, and which when bound by VGAM1315 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1315 host target proteins.

[18374] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1315 gene, herein designated VGAM GENE, on one or more VGAM1315 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [18375] It is yet further appreciated that a function of VGAM1315 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of viral infection by Foot-and-mouth disease virus C. Specific functions, and accordingly utilities, of VGAM1315 correlate with, and may be deduced from, the identity of the host target genes which VGAM1315 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [18376] Nucleotide sequences of the VGAM1315 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1315 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1315 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1315 are further described hereinbelow with reference to Table 1.
- [18377] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1315 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18378] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1316 (VGAM1316) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18379] VGAM1316 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1316 was detected is described hereinabove with reference to Figs. 2-8.

[18380] VGAM1316 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Foot-and-mouth disease virus C. VGAM1316 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18381] VGAM1316 gene, herein designated VGAM GENE, encodes a VGAM1316 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1316 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1316 precursor RNA is designated SEQ ID:1302, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1302 is located at position 3523 relative to the genome of Foot-and-mouth disease virus C.

[18382] VGAM1316 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1316 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18383] An enzyme complex designated DICER COMPLEX, dices the VGAM1316 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1316 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1316 RNA is designated SEQ ID:4027, and is provided hereinbelow with reference to the sequence listing part.

[18384] VGAM1316 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1316 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1316 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18385] VGAM1316 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1316 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1316 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1316 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18386] The complementary binding of VGAM1316 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1316 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1316 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1316 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18387] It is appreciated that VGAM1316 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1316 host target genes. The mRNA of each one of this plurality of VGAM1316 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1316 RNA, herein designated VGAM RNA, and which when bound by VGAM1316 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1316 host target proteins.

[18388] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1316 gene, herein designated VGAM GENE, on one or more VGAM1316 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18389] It is yet further appreciated that a function of VGAM1316 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of viral infection by Foot-and-mouth disease virus C. Specific functions, and accordingly utilities, of VGAM1316 correlate with, and may be deduced from, the identity of the host target genes which VGAM1316 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18390] Nucleotide sequences of the VGAM1316 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1316 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1316 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1316 are further described hereinbelow with reference to Table 1.

[18391] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1316 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18392] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1317 (VGAM1317) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18393] VGAM1317 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1317 was detected is described hereinabove with reference to Figs. 2-8.

[18394] VGAM1317 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Foot-and-mouth disease virus O. VGAM1317 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18395] VGAM1317 gene, herein designated VGAM GENE, encodes a VGAM1317 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1317 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1317 precursor RNA is designated SEQ ID:1303, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1303 is located at position 1129 relative to the genome of Foot-and-mouth disease virus O.

[18396] VGAM1317 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1317 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18397] An enzyme complex designated DICER COMPLEX, dices the VGAM1317 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1317 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1317 RNA is designated SEQ ID:4028, and is provided hereinbelow with reference to the sequence listing part.

[18398] VGAM1317 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1317 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1317 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18399] VGAM1317 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1317 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1317 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1317 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1317 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18400] The complementary binding of VGAM1317 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1317 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1317 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1317 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18401] It is appreciated that VGAM1317 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1317 host target genes. The mRNA of each one of this plurality of VGAM1317 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1317 RNA, herein designated VGAM RNA, and which when bound by VGAM1317 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1317 host target proteins.

[18402] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1317 gene, herein designated VGAM GENE, on one or more VGAM1317 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18403] It is yet further appreciated that a function of VGAM1317 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1317 include diagnosis, prevention and treatment of viral infection by Foot-and-mouth disease virus O. Specific functions, and accordingly utilities, of VGAM1317 correlate with, and may be deduced from, the identity of the host target genes which VGAM1317 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18404] Nucleotide sequences of the VGAM1317 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1317 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1317 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1317 are further described hereinbelow with reference to Table 1.

[18405] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1317 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18406] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1318 (VGAM1318) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18407] VGAM1318 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1318 was detected is described hereinabove with reference to Figs. 2-8.

[18408] VGAM1318 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Foot-and-mouth disease virus O. VGAM1318 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18409] VGAM1318 gene, herein designated VGAM GENE, encodes

a VGAM1318 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1318 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1318 precursor RNA is designated SEQ ID:1304, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1304 is located at position 7392 relative to the genome of Foot-and-mouth disease virus O.

[18410] VGAM1318 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1318 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18411] An enzyme complex designated DICER COMPLEX, dices the VGAM1318 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1318 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1318 RNA is designated SEQ ID:4029, and is provided hereinbelow with reference to the sequence listing part.

[18412] VGAM1318 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1318 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1318 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18413] VGAM1318 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1318 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1318 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1318 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1318 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18414] The complementary binding of VGAM1318 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1318 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1318

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1318 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18415] It is appreciated that VGAM1318 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1318 host target genes. The mRNA of each one of this plurality of VGAM1318 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1318 RNA, herein designated VGAM RNA, and which when bound by VGAM1318 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1318 host target proteins.

[18416] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1318 gene, herein designated VGAM GENE, on one or more VGAM1318 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18417] It is yet further appreciated that a function of VGAM1318 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1318 include diagnosis, prevention and treatment of viral infection by Foot-and-mouth disease virus O. Specific functions, and accordingly utilities, of VGAM1318 correlate with, and may be deduced from, the identity of the host target genes which VGAM1318 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18418] Nucleotide sequences of the VGAM1318 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1318 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1318 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1318 are further described hereinbelow with reference to Table 1.

[18419] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1318 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18420] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1319 (VGAM1319) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18421] VGAM1319 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1319 was detected is described hereinabove with reference to Figs. 2-8.

[18422] VGAM1319 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Foot-and-mouth disease virus O. VGAM1319 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene con-

tained in the human genome.

[18423] VGAM1319 gene, herein designated VGAM GENE, encodes a VGAM1319 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1319 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1319 precursor RNA is designated SEQ ID:1305, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1305 is located at position 6082 relative to the genome of Foot-and-mouth disease virus O.

[18424] VGAM1319 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1319 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18425] An enzyme complex designated DICER COMPLEX, dices the VGAM1319 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1319 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1319 RNA is designated SEQ ID:4030, and is provided hereinbelow with reference to the sequence listing part.

[18426] VGAM1319 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1319 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1319 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18427] VGAM1319 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1319 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1319 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1319 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1319 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18428] The complementary binding of VGAM1319 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1319 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1319 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1319 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18429] It is appreciated that VGAM1319 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1319 host target genes. The mRNA of each one of this plurality of VGAM1319 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1319 RNA, herein designated VGAM RNA, and which when bound by VGAM1319 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1319 host target proteins.

[18430] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1319 gene, herein designated VGAM GENE, on one or more VGAM1319 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18431] It is yet further appreciated that a function of VGAM1319 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1319 include diagnosis, prevention and treatment of viral infection by Foot-and-mouth disease virus O. Specific functions, and accordingly utilities, of VGAM1319 correlate with, and may be deduced from, the identity of the host target genes which VGAM1319 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18432] Nucleotide sequences of the VGAM1319 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1319 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1319 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1319 are further described hereinbelow with reference to Table 1.

[18433] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1319 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18434] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1320 (VGAM1320) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18435] VGAM1320 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1320 was detected is described hereinabove with reference to Figs. 2-8.

[18436] VGAM1320 gene, herein designated VGAM GENE, is a viral gene contained in the genome of *Melanoplus sanguinipes*

entomopoxvirus. VGAM1320 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18437] VGAM1320 gene, herein designated VGAM GENE, encodes a VGAM1320 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1320 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1320 precursor RNA is designated SEQ ID:1306, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1306 is located at position 221058 relative to the genome of *Melanoplus sanguinipes* entomopoxvirus.

[18438] VGAM1320 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1320 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18439] An enzyme complex designated DICER COMPLEX, dices the VGAM1320 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1320 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1320 RNA is designated SEQ ID:4031, and is provided hereinbelow with reference to the sequence listing part.

[18440] VGAM1320 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1320 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1320 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18441] VGAM1320 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1320 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1320 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1320 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1320 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18442] The complementary binding of VGAM1320 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1320 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1320 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1320 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18443] It is appreciated that VGAM1320 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1320 host target genes. The mRNA of each one of this plurality of VGAM1320 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1320 RNA, herein designated VGAM RNA, and which when bound by VGAM1320 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1320 host target proteins.

[18444] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1320 gene, herein designated VGAM GENE, on one or more VGAM1320 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18445] It is yet further appreciated that a function of VGAM1320 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1320 include diagnosis, prevention and treatment of viral infection by Melanoplus sanguinipes entomopoxvirus. Specific functions, and accordingly utilities, of VGAM1320 correlate with, and may be deduced from, the identity of the host target genes which VGAM1320 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18446] Nucleotide sequences of the VGAM1320 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1320 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1320 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1320 are further described hereinbelow with reference to Table 1.

[18447] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1320 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18448] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1321 (VGAM1321) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18449] VGAM1321 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1321 was detected is described hereinabove with reference to Figs. 2-8.

[18450] VGAM1321 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus sanguinipes entomopoxvirus. VGAM1321 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18451] VGAM1321 gene, herein designated VGAM GENE, encodes a VGAM1321 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1321 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1321 precursor RNA is designated SEQ ID:1307, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1307 is located at position 223345 relative to the genome of Melanoplus sanguinipes entomopoxvirus.

[18452] VGAM1321 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1321 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18453] An enzyme complex designated DICER COMPLEX, dices the VGAM1321 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1321 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1321 RNA is designated SEQ ID:4032, and is provided hereinbelow with reference to the sequence listing part.

[18454] VGAM1321 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1321 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1321 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18455] VGAM1321 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1321 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1321 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1321 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1321 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[18456] The complementary binding of VGAM1321 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1321 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1321 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1321 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18457] It is appreciated that VGAM1321 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1321 host target genes. The mRNA of each one of this plurality of VGAM1321 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1321 RNA, herein designated VGAM RNA, and which when bound by VGAM1321 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1321 host target proteins.

[18458] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1321 gene, herein designated VGAM GENE, on one or more VGAM1321 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18459] It is yet further appreciated that a function of VGAM1321 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1321 include diagnosis, prevention and treatment of viral infection by Melanoplus sanguinipes entomopoxvirus. Specific functions, and accordingly utilities, of VGAM1321 correlate with, and may be deduced from, the identity of the host target genes which VGAM1321 binds and inhibits, and the function of these host target

genes, as elaborated hereinbelow.

[18460] Nucleotide sequences of the VGAM1321 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1321 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1321 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1321 are further described hereinbelow with reference to Table 1.

[18461] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1321 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18462] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1322 (VGAM1322) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18463] VGAM1322 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1322 was detected is described hereinabove with reference to Figs. 2–8.

[18464] VGAM1322 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Garlic latent virus.

VGAM1322 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18465] VGAM1322 gene, herein designated VGAM GENE, encodes a VGAM1322 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1322 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1322 precursor RNA is designated SEQ ID:1308, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1308 is located at position 5259 relative to the genome of Garlic latent virus.

[18466] VGAM1322 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1322 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18467] An enzyme complex designated DICER COMPLEX, dices the VGAM1322 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1322 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM1322 RNA is designated SEQ ID:4033, and is provided hereinbelow with reference to the sequence listing part.

[18468] VGAM1322 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1322 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1322 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18469] VGAM1322 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1322 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1322 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1322 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18470] The complementary binding of VGAM1322 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1322 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1322 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1322 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18471] It is appreciated that VGAM1322 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1322 host target genes. The mRNA of each one of this plurality of VGAM1322 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1322 RNA, herein designated VGAM RNA, and which when bound by VGAM1322 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1322 host target proteins.

[18472] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1322 gene, herein designated VGAM GENE, on one or more VGAM1322 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18473] It is yet further appreciated that a function of VGAM1322 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of viral infection by Garlic latent virus. Specific functions, and accordingly utilities, of VGAM1322 correlate with, and may be deduced from, the identity of the host target genes which VGAM1322 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[18474] Nucleotide sequences of the VGAM1322 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1322 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1322 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1322 are further described hereinbelow with reference to Table 1.

[18475] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1322 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18476] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1323 (VGAM1323) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18477] VGAM1323 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1323 was detected is described hereinabove with reference to Figs. 2–8.

[18478] VGAM1323 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Garlic latent virus.

VGAM1323 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18479] VGAM1323 gene, herein designated VGAM GENE, encodes a VGAM1323 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1323 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1323 precursor RNA is designated SEQ ID:1309, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1309 is located at position 5155 relative to the genome of Garlic latent virus.

[18480] VGAM1323 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1323 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18481] An enzyme complex designated DICER COMPLEX, dices the VGAM1323 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1323 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM1323 RNA is designated SEQ ID:4034, and is provided hereinbelow with reference to the sequence listing part.

[18482] VGAM1323 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1323 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1323 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18483] VGAM1323 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1323 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1323 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1323 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1323 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18484] The complementary binding of VGAM1323 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1323 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1323 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1323 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18485] It is appreciated that VGAM1323 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1323 host target genes. The mRNA of each one of this plurality of VGAM1323 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1323 RNA, herein designated VGAM RNA, and which when bound by VGAM1323 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1323 host target proteins.

[18486] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1323 gene, herein designated VGAM GENE, on one or more VGAM1323 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18487] It is yet further appreciated that a function of VGAM1323 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1323 include diagnosis, prevention and treatment of viral infection by Garlic latent virus. Specific functions, and accordingly utilities, of VGAM1323 correlate with, and may be deduced from, the identity of the

host target genes which VGAM1323 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18488] Nucleotide sequences of the VGAM1323 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1323 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1323 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1323 are further described hereinbelow with reference to Table 1.

[18489] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1323 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18490] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1324 (VGAM1324) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18491] VGAM1324 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1324 was detected is described hereinabove with reference to Figs. 2-8.

[18492] VGAM1324 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Garlic latent virus. VGAM1324 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18493] VGAM1324 gene, herein designated VGAM GENE, encodes a VGAM1324 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1324 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1324 precursor RNA is designated SEQ ID:1310, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1310 is located at position 4855 relative to the genome of Garlic latent virus.

[18494] VGAM1324 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1324 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18495] An enzyme complex designated DICER COMPLEX, dices the VGAM1324 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1324 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM1324 RNA is designated SEQ ID:4035, and is provided hereinbelow with reference to the sequence listing part.

[18496] VGAM1324 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1324 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1324 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18497] VGAM1324 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1324 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1324 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1324 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18498] The complementary binding of VGAM1324 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1324 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1324 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1324 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18499] It is appreciated that VGAM1324 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1324 host target genes. The mRNA of each one of this plurality of VGAM1324 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1324 RNA, herein designated VGAM RNA, and which when bound by VGAM1324 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1324 host target proteins.

[18500] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1324 gene, herein designated VGAM GENE, on one or more VGAM1324 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18501] It is yet further appreciated that a function of VGAM1324 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of viral infection by Garlic latent virus. Specific functions, and accordingly utilities, of VGAM1324 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM1324 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18502] Nucleotide sequences of the VGAM1324 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1324 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1324 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1324 are further described hereinbelow with reference to Table 1.

[18503] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1324 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18504] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1325 (VGAM1325) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[18505] VGAM1325 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1325 was detected is described hereinabove with reference to Figs. 2–8.

[18506] VGAM1325 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Garlic latent virus. VGAM1325 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18507] VGAM1325 gene, herein designated VGAM GENE, encodes a VGAM1325 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1325 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1325 precursor RNA is designated SEQ ID:1311, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1311 is located at position 3735 relative to the genome of Garlic latent virus.

[18508] VGAM1325 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1325 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18509] An enzyme complex designated DICER COMPLEX, dices the VGAM1325 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1325 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1325 RNA is designated SEQ ID:4036, and is provided hereinbelow with reference to the sequence listing part.

[18510] VGAM1325 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1325 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1325 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18511] VGAM1325 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1325 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1325 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1325 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1325 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18512] The complementary binding of VGAM1325 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1325 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1325 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1325 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18513] It is appreciated that VGAM1325 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1325 host target genes. The mRNA of each one of this plurality of VGAM1325 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1325 RNA, herein designated VGAM RNA, and which when bound by VGAM1325 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1325 host target proteins.

[18514] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1325 gene, herein designated VGAM GENE, on one or more VGAM1325 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18515] It is yet further appreciated that a function of VGAM1325 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1325 include diagnosis, prevention and treatment of viral infection by Garlic latent virus. Specific

functions, and accordingly utilities, of VGAM1325 correlate with, and may be deduced from, the identity of the host target genes which VGAM1325 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18516] Nucleotide sequences of the VGAM1325 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1325 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1325 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1325 are further described hereinbelow with reference to Table 1.

[18517] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1325 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18518] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1326 (VGAM1326) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[18519] VGAM1326 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1326 was detected is described hereinabove with reference to Figs. 2–8.

[18520] VGAM1326 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma virus.

VGAM1326 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18521] VGAM1326 gene, herein designated VGAM GENE, encodes a VGAM1326 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1326 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1326 precursor RNA is designated SEQ ID:1312, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1312 is located at position 91066 relative to the genome of Myxoma virus.

[18522] VGAM1326 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1326 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18523] An enzyme complex designated DICER COMPLEX, dices the VGAM1326 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1326 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1326 RNA is designated SEQ ID:4037, and is provided hereinbelow with reference to the sequence listing part.

[18524] VGAM1326 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1326 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1326 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18525] VGAM1326 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1326 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1326 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1326 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18526] The complementary binding of VGAM1326 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1326 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1326 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1326 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18527] It is appreciated that VGAM1326 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1326 host target genes. The mRNA of each one of this plurality of VGAM1326 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1326 RNA, herein designated VGAM RNA, and which when bound by VGAM1326 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1326 host target proteins.

[18528] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1326 gene, herein designated VGAM GENE, on one or more VGAM1326 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18529] It is yet further appreciated that a function of VGAM1326 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1326 include diagnosis, prevention and

treatment of viral infection by Myxoma virus. Specific functions, and accordingly utilities, of VGAM1326 correlate with, and may be deduced from, the identity of the host target genes which VGAM1326 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18530] Nucleotide sequences of the VGAM1326 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1326 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1326 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1326 are further described hereinbelow with reference to Table 1.

[18531] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1326 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18532] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1327 (VGAM1327) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18533] VGAM1327 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1327 was detected is described hereinabove with reference to Figs. 2–8.

[18534] VGAM1327 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma virus. VGAM1327 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18535] VGAM1327 gene, herein designated VGAM GENE, encodes a VGAM1327 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1327 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1327 precursor RNA is designated SEQ ID:1313, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1313 is located at position 86115 relative to the genome of Myxoma virus.

[18536] VGAM1327 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1327 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18537] An enzyme complex designated DICER COMPLEX, dices the VGAM1327 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1327 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1327 RNA is designated SEQ ID:4038, and is provided hereinbelow with reference to the sequence listing part.

[18538] VGAM1327 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1327 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1327 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18539] VGAM1327 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1327 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1327 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1327 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1327 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18540] The complementary binding of VGAM1327 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1327 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1327 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1327 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18541] It is appreciated that VGAM1327 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1327 host target genes. The mRNA of each one of this plurality of VGAM1327 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1327 RNA, herein designated VGAM

RNA, and which when bound by VGAM1327 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1327 host target proteins.

[18542] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1327 gene, herein designated VGAM GENE, on one or more VGAM1327 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18543] It is yet further appreciated that a function of VGAM1327 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1327 include diagnosis, prevention and treatment of viral infection by Myxoma virus. Specific functions, and accordingly utilities, of VGAM1327 correlate with, and may be deduced from, the identity of the host target genes which VGAM1327 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18544] Nucleotide sequences of the VGAM1327 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM1327 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1327 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1327 are further described hereinbelow with reference to Table 1.

[18545] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1327 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18546] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1328 (VGAM1328) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18547] VGAM1328 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1328 was detected is described hereinabove with reference to Figs. 2-8.

[18548] VGAM1328 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma virus. VGAM1328 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18549] VGAM1328 gene, herein designated VGAM GENE, encodes a VGAM1328 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1328 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1328 precursor RNA is designated SEQ ID:1314, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1314 is located at position

84471 relative to the genome of Myxoma virus.

[18550] VGAM1328 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1328 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18551] An enzyme complex designated DICER COMPLEX, dices the VGAM1328 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1328 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1328 RNA is designated SEQ ID:4039, and is provided hereinbelow with reference to the sequence listing part.

[18552] VGAM1328 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1328 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1328 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18553] VGAM1328 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1328 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1328 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1328 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1328 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18554] The complementary binding of VGAM1328 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1328 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1328 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1328 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18555] It is appreciated that VGAM1328 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1328 host target genes. The mRNA of each one of this plurality of VGAM1328 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1328 RNA, herein designated VGAM RNA, and which when bound by VGAM1328 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1328 host target proteins.

[18556] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1328 gene, herein designated VGAM GENE, on one or more VGAM1328 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18557] It is yet further appreciated that a function of VGAM1328 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1328 include diagnosis, prevention and treatment of viral infection by Myxoma virus. Specific functions, and accordingly utilities, of VGAM1328 correlate with, and may be deduced from, the identity of the host target genes which VGAM1328 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18558] Nucleotide sequences of the VGAM1328 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1328 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1328 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1328 are further described hereinbelow with reference to Table 1.

[18559] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1328 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18560] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1329 (VGAM1329) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18561] VGAM1329 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1329 was detected is described hereinabove with reference to Figs. 2–8.

[18562] VGAM1329 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Garlic virus C. VGAM1329 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18563] VGAM1329 gene, herein designated VGAM GENE, encodes a VGAM1329 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1329 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1329 precursor RNA is designated SEQ ID:1315, and is provided hereinbelow with reference to the sequence listing part. Nu–

cleotide sequence SEQ ID:1315 is located at position 7174 relative to the genome of Garlic virus C.

[18564] VGAM1329 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1329 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18565] An enzyme complex designated DICER COMPLEX, dices the VGAM1329 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1329 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1329 RNA is designated SEQ ID:4040, and is provided hereinbelow with reference to the sequence

listing part.

[18566] VGAM1329 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1329 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1329 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18567] VGAM1329 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1329 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1329 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1329 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1329 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18568] The complementary binding of VGAM1329 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1329 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1329 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1329 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18569] It is appreciated that VGAM1329 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1329 host target genes. The mRNA of each one of this plurality of VGAM1329 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1329 RNA, herein designated VGAM RNA, and which when bound by VGAM1329 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1329 host target proteins.

[18570] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1329 gene, herein designated VGAM GENE, on one or more VGAM1329 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18571] It is yet further appreciated that a function of VGAM1329

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1329 include diagnosis, prevention and treatment of viral infection by Garlic virus C. Specific functions, and accordingly utilities, of VGAM1329 correlate with, and may be deduced from, the identity of the host target genes which VGAM1329 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18572] Nucleotide sequences of the VGAM1329 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1329 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1329 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1329 are further described hereinbelow with reference to Table 1.

[18573] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1329 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18574] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1330 (VGAM1330) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18575] VGAM1330 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1330 was detected is described hereinabove with reference to Figs. 2–8.

[18576] VGAM1330 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus A. VGAM1330 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18577] VGAM1330 gene, herein designated VGAM GENE, encodes a VGAM1330 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1330 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1330 precursor RNA is designated SEQ ID:1316, and is provided here–

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1316 is located at position 27688 relative to the genome of Human adenovirus A.

[18578] VGAM1330 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1330 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18579] An enzyme complex designated DICER COMPLEX, dices the VGAM1330 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1330 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1330 RNA is designated SEQ ID:4041, and

is provided hereinbelow with reference to the sequence listing part.

[18580] VGAM1330 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1330 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1330 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18581] VGAM1330 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1330 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1330 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1330 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1330 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18582] The complementary binding of VGAM1330 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1330 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1330 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1330 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18583] It is appreciated that VGAM1330 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1330 host target genes. The mRNA of each one of this plurality of VGAM1330 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1330 RNA, herein designated VGAM RNA, and which when bound by VGAM1330 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1330 host target proteins.

[18584] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1330 gene, herein designated VGAM GENE, on one or more VGAM1330 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18585] It is yet further appreciated that a function of VGAM1330 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1330 include diagnosis, prevention and treatment of viral infection by Human adenovirus A. Specific functions, and accordingly utilities, of VGAM1330 correlate with, and may be deduced from, the identity of the host target genes which VGAM1330 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18586] Nucleotide sequences of the VGAM1330 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM1330 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1330 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1330 are further described hereinbelow with reference to Table 1.

[18587] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1330 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18588] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1331 (VGAM1331) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18589] VGAM1331 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1331 was detected is described hereinabove with reference to Figs. 2–8.

[18590] VGAM1331 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus A. VGAM1331 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18591] VGAM1331 gene, herein designated VGAM GENE, encodes a VGAM1331 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1331 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1331 precu-

sor RNA is designated SEQ ID:1317, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1317 is located at position 25669 relative to the genome of Human adenovirus A.

[18592] VGAM1331 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1331 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18593] An enzyme complex designated DICER COMPLEX, dices the VGAM1331 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1331 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide se-

quence of VGAM1331 RNA is designated SEQ ID:4042, and is provided hereinbelow with reference to the sequence listing part.

[18594] VGAM1331 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1331 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1331 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18595] VGAM1331 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1331 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1331 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1331 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1331 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18596] The complementary binding of VGAM1331 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1331 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1331 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1331 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18597] It is appreciated that VGAM1331 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1331 host target genes. The mRNA of

each one of this plurality of VGAM1331 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1331 RNA, herein designated VGAM RNA, and which when bound by VGAM1331 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1331 host target proteins.

[18598] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1331 gene, herein designated VGAM GENE, on one or more VGAM1331 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[18599] It is yet further appreciated that a function of VGAM1331 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1331 include diagnosis, prevention and treatment of viral infection by Human adenovirus A. Specific functions, and accordingly utilities, of VGAM1331 correlate with, and may be deduced from, the identity of the host target genes which VGAM1331 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18600] Nucleotide sequences of the VGAM1331 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1331 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1331 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1331 are further described hereinbelow with reference to Table 1.

[18601] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1331 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[18602] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1332 (VGAM1332) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18603] VGAM1332 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1332 was detected is described hereinabove with reference to Figs. 2–8.

[18604] VGAM1332 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus A. VGAM1332 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18605] VGAM1332 gene, herein designated VGAM GENE, encodes a VGAM1332 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1332 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1332 precursor RNA is designated SEQ ID:1318, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1318 is located at position 26522 relative to the genome of Human adenovirus A.

[18606] VGAM1332 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1332 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18607] An enzyme complex designated DICER COMPLEX, dices the VGAM1332 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1332 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1332 RNA is designated SEQ ID:4043, and is provided hereinbelow with reference to the sequence listing part.

[18608] VGAM1332 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1332 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1332 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18609] VGAM1332 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1332 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1332 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1332 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1332 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18610] The complementary binding of VGAM1332 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1332 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1332 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1332 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18611] It is appreciated that VGAM1332 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1332 host target genes. The mRNA of each one of this plurality of VGAM1332 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1332 RNA, herein designated VGAM RNA, and which when bound by VGAM1332 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1332 host target proteins.

[18612] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1332 gene, herein designated VGAM GENE, on one or more VGAM1332 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [18613] It is yet further appreciated that a function of VGAM1332 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1332 include diagnosis, prevention and treatment of viral infection by Human adenovirus A. Specific functions, and accordingly utilities, of VGAM1332 correlate with, and may be deduced from, the identity of the host target genes which VGAM1332 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [18614] Nucleotide sequences of the VGAM1332 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM1332 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1332 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1332 are further described hereinbelow with reference to Table 1.
- [18615] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1332 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18616] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1333 (VGAM1333) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18617] VGAM1333 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1333 was detected is described hereinabove with reference to Figs. 2-8.

[18618] VGAM1333 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus A. VGAM1333 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18619] VGAM1333 gene, herein designated VGAM GENE, encodes a VGAM1333 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1333 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1333 precursor RNA is designated SEQ ID:1319, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1319 is located at position 24338 relative to the genome of Human adenovirus A.

[18620] VGAM1333 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1333 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18621] An enzyme complex designated DICER COMPLEX, dices the VGAM1333 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1333 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM1333 RNA is designated SEQ ID:4044, and is provided hereinbelow with reference to the sequence listing part.

[18622] VGAM1333 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1333 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1333 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18623] VGAM1333 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1333 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1333 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1333 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1333 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18624] The complementary binding of VGAM1333 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1333 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1333 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1333 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18625] It is appreciated that VGAM1333 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1333 host target genes. The mRNA of each one of this plurality of VGAM1333 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1333 RNA, herein designated VGAM RNA, and which when bound by VGAM1333 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1333 host target proteins.

[18626] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1333 gene, herein designated VGAM GENE, on one or more VGAM1333 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18627] It is yet further appreciated that a function of VGAM1333 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1333 include diagnosis, prevention and treatment of viral infection by Human adenovirus A. Specific functions, and accordingly utilities, of VGAM1333 correlate with, and may be deduced from, the identity of the host target genes which VGAM1333 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18628] Nucleotide sequences of the VGAM1333 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1333 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1333 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1333 are further described hereinbelow with reference to Table 1.

[18629] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1333 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18630] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1334 (VGAM1334) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18631] VGAM1334 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1334 was detected is described hereinabove with reference to Figs. 2–8.

[18632] VGAM1334 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus A. VGAM1334 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18633] VGAM1334 gene, herein designated VGAM GENE, encodes a VGAM1334 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1334 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1334 precursor RNA is designated SEQ ID:1320, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1320 is located at position 28536 relative to the genome of Human adenovirus A.

[18634] VGAM1334 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1334 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18635] An enzyme complex designated DICER COMPLEX, dices the VGAM1334 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1334 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1334 RNA is designated SEQ ID:4045, and is provided hereinbelow with reference to the sequence listing part.

[18636] VGAM1334 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1334 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1334 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18637] VGAM1334 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1334 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1334 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1334 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1334 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18638] The complementary binding of VGAM1334 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1334 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1334 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1334 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18639] It is appreciated that VGAM1334 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1334 host target genes. The mRNA of each one of this plurality of VGAM1334 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1334 RNA, herein designated VGAM RNA, and which when bound by VGAM1334 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1334 host target proteins.

[18640] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1334 gene, herein designated VGAM GENE, on one or more VGAM1334 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18641] It is yet further appreciated that a function of VGAM1334 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1334 include diagnosis, prevention and treatment of viral infection by Human adenovirus A. Specific functions, and accordingly utilities, of VGAM1334 correlate with, and may be deduced from, the identity of the host target genes which VGAM1334 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18642] Nucleotide sequences of the VGAM1334 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1334 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1334 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1334 are further described hereinbelow with reference to Table 1.

[18643] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1334 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18644] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1335 (VGAM1335) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18645] VGAM1335 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1335 was detected is described hereinabove with reference to Figs. 2-8.

[18646] VGAM1335 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus A. VGAM1335 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18647] VGAM1335 gene, herein designated VGAM GENE, encodes a VGAM1335 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1335 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1335 precursor RNA is designated SEQ ID:1321, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1321 is located at position 27935 relative to the genome of Human adenovirus A.

[18648] VGAM1335 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1335 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18649] An enzyme complex designated DICER COMPLEX, dices the VGAM1335 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1335 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1335 RNA is designated SEQ ID:4046, and is provided hereinbelow with reference to the sequence listing part.

[18650] VGAM1335 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1335 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1335 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18651] VGAM1335 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1335 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1335 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1335 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1335 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18652] The complementary binding of VGAM1335 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1335 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1335 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1335 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[18653] It is appreciated that VGAM1335 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1335 host target genes. The mRNA of each one of this plurality of VGAM1335 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1335 RNA, herein designated VGAM RNA, and which when bound by VGAM1335 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1335 host target proteins.

[18654] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1335 gene, herein designated VGAM GENE, on one or more VGAM1335 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18655] It is yet further appreciated that a function of VGAM1335 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1335 include diagnosis, prevention and treatment of viral infection by Human adenovirus A. Specific functions, and accordingly utilities, of VGAM1335 correlate with, and may be deduced from, the identity of the host target genes which VGAM1335 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18656] Nucleotide sequences of the VGAM1335 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM1335 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1335 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1335 are further described hereinbelow with reference to Table 1.

[18657] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1335 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18658] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1336 (VGAM1336) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18659] VGAM1336 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1336 was detected is described hereinabove with reference to Figs. 2-8.

[18660] VGAM1336 gene, herein designated VGAM GENE, is a viral gene contained in the genome of sheeppox virus. VGAM1336 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18661] VGAM1336 gene, herein designated VGAM GENE, encodes a VGAM1336 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1336 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1336 precursor RNA is designated SEQ ID:1322, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1322 is located at position 83573 relative to the genome of sheeppox virus.

[18662] VGAM1336 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1336 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18663] An enzyme complex designated DICER COMPLEX, dices the VGAM1336 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1336 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1336 RNA is designated SEQ ID:4047, and is provided hereinbelow with reference to the sequence listing part.

[18664] VGAM1336 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1336 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1336 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18665] VGAM1336 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1336 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1336 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1336 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1336 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18666] The complementary binding of VGAM1336 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1336 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1336 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1336 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18667] It is appreciated that VGAM1336 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1336 host target genes. The mRNA of each one of this plurality of VGAM1336 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1336 RNA, herein designated VGAM RNA, and which when bound by VGAM1336 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1336 host target proteins.

[18668] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1336 gene, herein designated VGAM GENE, on one or more VGAM1336 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18669] It is yet further appreciated that a function of VGAM1336 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1336 include diagnosis, prevention and treatment of viral infection by sheeppox virus. Specific functions, and accordingly utilities, of VGAM1336 correlate with, and may be deduced from, the identity of the host target genes which VGAM1336 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18670] Nucleotide sequences of the VGAM1336 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1336 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1336 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1336 are further described hereinbelow with reference to Table 1.

[18671] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1336 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18672] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1337 (VGAM1337) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18673] VGAM1337 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1337 was detected is described hereinabove with reference to Figs. 2-8.

[18674] VGAM1337 gene, herein designated VGAM GENE, is a viral gene contained in the genome of sheeppox virus. VGAM1337 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18675] VGAM1337 gene, herein designated VGAM GENE, encodes

a VGAM1337 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1337 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1337 precursor RNA is designated SEQ ID:1323, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1323 is located at position 84667 relative to the genome of sheeppox virus.

[18676] VGAM1337 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1337 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18677] An enzyme complex designated DICER COMPLEX, dices the VGAM1337 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1337 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1337 RNA is designated SEQ ID:4048, and is provided hereinbelow with reference to the sequence listing part.

[18678] VGAM1337 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1337 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1337 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18679] VGAM1337 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1337 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1337 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1337 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1337 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18680] The complementary binding of VGAM1337 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1337 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1337 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1337 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18681] It is appreciated that VGAM1337 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1337 host target genes. The mRNA of each one of this plurality of VGAM1337 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1337 RNA, herein designated VGAM RNA, and which when bound by VGAM1337 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1337 host target proteins.

[18682] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1337 gene, herein designated VGAM GENE, on one or more VGAM1337 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18683] It is yet further appreciated that a function of VGAM1337 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1337 include diagnosis, prevention and treatment of viral infection by sheeppox virus. Specific functions, and accordingly utilities, of VGAM1337 correlate with, and may be deduced from, the identity of the host target genes which VGAM1337 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18684] Nucleotide sequences of the VGAM1337 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM1337 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1337 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1337 are further

described hereinbelow with reference to Table 1.

[18685] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1337 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18686] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1338 (VGAM1338) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18687] VGAM1338 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1338 was detected is described hereinabove with reference to Figs. 2-8.

[18688] VGAM1338 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM1338 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18689] VGAM1338 gene, herein designated VGAM GENE, encodes

a VGAM1338 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1338 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1338 precursor RNA is designated SEQ ID:1324, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1324 is located at position 146622 relative to the genome of Variola virus.

[18690] VGAM1338 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1338 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18691] An enzyme complex designated DICER COMPLEX, dices the VGAM1338 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1338 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1338 RNA is designated SEQ ID:4049, and is provided hereinbelow with reference to the sequence listing part.

[18692] VGAM1338 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1338 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1338 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18693] VGAM1338 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1338 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1338 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1338 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1338 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18694] The complementary binding of VGAM1338 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1338 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1338 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1338 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18695] It is appreciated that VGAM1338 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1338 host target genes. The mRNA of each one of this plurality of VGAM1338 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1338 RNA, herein designated VGAM RNA, and which when bound by VGAM1338 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1338 host target proteins.

[18696] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1338 gene, herein designated VGAM GENE, on one or more VGAM1338 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18697] It is yet further appreciated that a function of VGAM1338 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1338 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM1338 correlate with, and may be deduced from, the identity of the host target genes which VGAM1338 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18698] Nucleotide sequences of the VGAM1338 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM1338 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1338 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1338 are further

described hereinbelow with reference to Table 1.

[18699] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1338 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18700] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1339 (VGAM1339) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18701] VGAM1339 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1339 was detected is described hereinabove with reference to Figs. 2-8.

[18702] VGAM1339 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM1339 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18703] VGAM1339 gene, herein designated VGAM GENE, encodes a VGAM1339 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1339 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1339 precursor RNA is designated SEQ ID:1325, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1325 is located at position 245147 relative to the genome of Fowlpox virus.

[18704] VGAM1339 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1339 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18705] An enzyme complex designated DICER COMPLEX, dices the VGAM1339 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1339 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1339 RNA is designated SEQ ID:4050, and is provided hereinbelow with reference to the sequence listing part.

[18706] VGAM1339 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1339 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1339 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18707] VGAM1339 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1339 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1339 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1339 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1339 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18708] The complementary binding of VGAM1339 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1339 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1339

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1339 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18709] It is appreciated that VGAM1339 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1339 host target genes. The mRNA of each one of this plurality of VGAM1339 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1339 RNA, herein designated VGAM RNA, and which when bound by VGAM1339 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1339 host target proteins.

[18710] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1339 gene, herein designated VGAM GENE, on one or more VGAM1339 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18711] It is yet further appreciated that a function of VGAM1339 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1339 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM1339 correlate with, and may be deduced from, the identity of the host target genes which VGAM1339 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18712] Nucleotide sequences of the VGAM1339 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1339 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1339 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1339 are further described hereinbelow with reference to Table 1.

[18713] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1339 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18714] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1340 (VGAM1340) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18715] VGAM1340 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1340 was detected is described hereinabove with reference to Figs. 2-8.

[18716] VGAM1340 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Garlic virus A. VGAM1340 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[18717] VGAM1340 gene, herein designated VGAM GENE, encodes a VGAM1340 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1340 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1340 precursor RNA is designated SEQ ID:1326, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1326 is located at position 7154 relative to the genome of Garlic virus A.

[18718] VGAM1340 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1340 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18719] An enzyme complex designated DICER COMPLEX, dices

the VGAM1340 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1340 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM1340 RNA is designated SEQ ID:4051, and is provided hereinbelow with reference to the sequence listing part.

[18720] VGAM1340 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1340 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1340 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18721] VGAM1340 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1340 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1340 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1340 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1340 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18722] The complementary binding of VGAM1340 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1340 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1340 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1340 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18723] It is appreciated that VGAM1340 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1340 host target genes. The mRNA of each one of this plurality of VGAM1340 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1340 RNA, herein designated VGAM RNA, and which when bound by VGAM1340 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1340 host target proteins.

[18724] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1340 gene, herein designated VGAM GENE, on one or more VGAM1340 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18725] It is yet further appreciated that a function of VGAM1340 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1340 include diagnosis, prevention and treatment of viral infection by Garlic virus A. Specific functions, and accordingly utilities, of VGAM1340 correlate with, and may be deduced from, the identity of the host target genes which VGAM1340 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18726] Nucleotide sequences of the VGAM1340 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1340 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1340 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1340 are further described hereinbelow with reference to Table 1.

[18727] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1340 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18728] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1341 (VGAM1341) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18729] VGAM1341 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1341 was detected is described hereinabove with reference to Figs. 2-8.

[18730] VGAM1341 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Garlic virus A. VGAM1341 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[18731] VGAM1341 gene, herein designated VGAM GENE, encodes a VGAM1341 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1341 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1341 precursor RNA is designated SEQ ID:1327, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1327 is located at position 6737 relative to the genome of Garlic virus A.

[18732] VGAM1341 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1341 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18733] An enzyme complex designated DICER COMPLEX, dices the VGAM1341 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1341 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1341 RNA is designated SEQ ID:4052, and is provided hereinbelow with reference to the sequence listing part.

[18734] VGAM1341 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1341 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1341 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18735] VGAM1341 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1341 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1341 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1341 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1341 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18736] The complementary binding of VGAM1341 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1341 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1341 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1341 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18737] It is appreciated that VGAM1341 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1341 host target genes. The mRNA of each one of this plurality of VGAM1341 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1341 RNA, herein designated VGAM RNA, and which when bound by VGAM1341 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1341 host target proteins.

[18738] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1341 gene, herein designated VGAM GENE, on one or more VGAM1341 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18739] It is yet further appreciated that a function of VGAM1341 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1341 include diagnosis, prevention and treatment of viral infection by Garlic virus A. Specific functions, and accordingly utilities, of VGAM1341 correlate with, and may be deduced from, the identity of the host target genes which VGAM1341 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18740] Nucleotide sequences of the VGAM1341 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1341 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1341 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1341 are further described hereinbelow with reference to Table 1.

[18741] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1341 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18742] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1342 (VGAM1342) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18743] VGAM1342 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1342 was detected is described hereinabove with reference to Figs. 2-8.

[18744] VGAM1342 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Garlic virus A.

VGAM1342 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18745] VGAM1342 gene, herein designated VGAM GENE, encodes a VGAM1342 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1342 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1342 precursor RNA is designated SEQ ID:1328, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1328 is located at position 2936 relative to the genome of Garlic virus A.

[18746] VGAM1342 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1342 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[18747] An enzyme complex designated DICER COMPLEX, dices the VGAM1342 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1342 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of VGAM1342 RNA is designated SEQ ID:4053, and is provided hereinbelow with reference to the sequence listing part.

[18748] VGAM1342 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1342 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1342 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18749] VGAM1342 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1342 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1342 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1342 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1342 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18750] The complementary binding of VGAM1342 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1342 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1342 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1342 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18751] It is appreciated that VGAM1342 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1342 host target genes. The mRNA of each one of this plurality of VGAM1342 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1342 RNA, herein designated VGAM RNA, and which when bound by VGAM1342 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1342 host target proteins.

[18752] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1342 gene, herein designated VGAM GENE, on one or more VGAM1342 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18753] It is yet further appreciated that a function of VGAM1342 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1342 include diagnosis, prevention and treatment of viral infection by Garlic virus A. Specific functions, and accordingly utilities, of VGAM1342 correlate with, and may be deduced from, the identity of the host target genes which VGAM1342 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18754] Nucleotide sequences of the VGAM1342 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1342 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1342 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1342 are further described hereinbelow with reference to Table 1.

[18755] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1342 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18756] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1343 (VGAM1343) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18757] VGAM1343 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1343 was detected is described hereinabove with reference to Figs. 2-8.

[18758] VGAM1343 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Garlic virus A.

VGAM1343 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18759] VGAM1343 gene, herein designated VGAM GENE, encodes a VGAM1343 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1343 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1343 precursor RNA is designated SEQ ID:1329, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1329 is located at position 1501 relative to the genome of Garlic virus A.

[18760] VGAM1343 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1343 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18761] An enzyme complex designated DICER COMPLEX, dices the VGAM1343 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1343 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM1343 RNA is designated SEQ ID:4054, and is provided hereinbelow with reference to the sequence listing part.

[18762] VGAM1343 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1343 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1343 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18763] VGAM1343 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1343 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1343 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1343 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1343 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18764] The complementary binding of VGAM1343 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1343 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1343 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1343 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18765] It is appreciated that VGAM1343 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1343 host target genes. The mRNA of each one of this plurality of VGAM1343 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1343 RNA, herein designated VGAM RNA, and which when bound by VGAM1343 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1343 host target proteins.

[18766] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1343 gene, herein designated VGAM GENE, on one or more VGAM1343 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18767] It is yet further appreciated that a function of VGAM1343 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1343 include diagnosis, prevention and treatment of viral infection by Garlic virus A. Specific functions, and accordingly utilities, of VGAM1343 correlate with, and may be deduced from, the identity of the host target genes which VGAM1343 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18768] Nucleotide sequences of the VGAM1343 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1343 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1343 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1343 are further described hereinbelow with reference to Table 1.

[18769] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1343 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18770] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1344 (VGAM1344) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18771] VGAM1344 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1344 was detected is described hereinabove with reference to Figs. 2-8.

[18772] VGAM1344 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca mulatta rhadinovirus. VGAM1344 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18773] VGAM1344 gene, herein designated VGAM GENE, encodes a VGAM1344 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1344 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1344 precursor RNA is designated SEQ ID:1330, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1330 is located at position 128312 relative to the genome of Macaca mulatta rhadinovirus.

[18774] VGAM1344 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1344 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18775] An enzyme complex designated DICER COMPLEX, dices the VGAM1344 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1344 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM1344 RNA is designated SEQ ID:4055, and is provided hereinbelow with reference to the sequence listing part.

[18776] VGAM1344 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1344 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1344 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18777] VGAM1344 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1344 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1344 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1344 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1344 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[18778] The complementary binding of VGAM1344 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1344 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1344 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1344 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18779] It is appreciated that VGAM1344 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1344 host target genes. The mRNA of each one of this plurality of VGAM1344 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1344 RNA, herein designated VGAM RNA, and which when bound by VGAM1344 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1344 host target proteins.

[18780] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1344 gene, herein designated VGAM GENE, on one or more VGAM1344 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18781] It is yet further appreciated that a function of VGAM1344 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1344 include diagnosis, prevention and treatment of viral infection by *Macaca mulatta* rhadinovirus. Specific functions, and accordingly utilities, of VGAM1344 correlate with, and may be deduced from, the identity of the host target genes which VGAM1344 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[18782] Nucleotide sequences of the VGAM1344 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1344 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1344 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1344 are further described hereinbelow with reference to Table 1.

[18783] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1344 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18784] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1345 (VGAM1345) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18785] VGAM1345 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1345 was detected is described hereinabove with reference to Figs. 2–8.

[18786] VGAM1345 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 1. VGAM1345 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18787] VGAM1345 gene, herein designated VGAM GENE, encodes a VGAM1345 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1345 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1345 precursor RNA is designated SEQ ID:1331, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1331 is located at position 123564 relative to the genome of Bovine herpesvirus 1.

[18788] VGAM1345 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1345 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18789] An enzyme complex designated DICER COMPLEX, dices the VGAM1345 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1345 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM1345 RNA is designated SEQ ID:4056, and is provided hereinbelow with reference to the sequence listing part.

[18790] VGAM1345 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1345 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1345 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18791] VGAM1345 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1345 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1345 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1345 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1345 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18792] The complementary binding of VGAM1345 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1345 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1345 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1345 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18793] It is appreciated that VGAM1345 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1345 host target genes. The mRNA of each one of this plurality of VGAM1345 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1345 RNA, herein designated VGAM RNA, and which when bound by VGAM1345 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1345 host target proteins.

[18794] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1345 gene, herein designated VGAM GENE, on one or more VGAM1345 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18795] It is yet further appreciated that a function of VGAM1345 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1345 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1345 correlate with, and may be deduced from, the identity of the host target genes which VGAM1345 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[18796] Nucleotide sequences of the VGAM1345 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1345 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1345 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1345 are further described hereinbelow with reference to Table 1.

[18797] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1345 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18798] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1346 (VGAM1346) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18799] VGAM1346 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1346 was detected is described hereinabove with reference to Figs. 2–8.

[18800] VGAM1346 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM1346 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18801] VGAM1346 gene, herein designated VGAM GENE, encodes a VGAM1346 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1346 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1346 precursor RNA is designated SEQ ID:1332, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1332 is located at position 256840 relative to the genome of Fowlpox virus.

[18802] VGAM1346 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1346 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18803] An enzyme complex designated DICER COMPLEX, dices the VGAM1346 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1346 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1346 RNA is designated SEQ ID:4057, and is provided hereinbelow with reference to the sequence listing part.

[18804] VGAM1346 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1346 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1346 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18805] VGAM1346 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1346 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1346 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1346 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1346 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18806] The complementary binding of VGAM1346 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1346 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1346 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1346 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18807] It is appreciated that VGAM1346 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1346 host target genes. The mRNA of each one of this plurality of VGAM1346 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1346 RNA, herein designated VGAM RNA, and which when bound by VGAM1346 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1346 host target proteins.

[18808] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1346 gene, herein designated VGAM GENE, on one or more VGAM1346 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18809] It is yet further appreciated that a function of VGAM1346 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1346 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM1346 correlate with, and may be deduced from, the identity of the

host target genes which VGAM1346 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18810] Nucleotide sequences of the VGAM1346 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1346 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1346 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1346 are further described hereinbelow with reference to Table 1.

[18811] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1346 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18812] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1347 (VGAM1347) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18813] VGAM1347 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1347 was detected is described hereinabove with reference to Figs. 2-8.

[18814] VGAM1347 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM1347 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18815] VGAM1347 gene, herein designated VGAM GENE, encodes a VGAM1347 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1347 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1347 precursor RNA is designated SEQ ID:1333, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1333 is located at position 251073 relative to the genome of Fowlpox virus.

[18816] VGAM1347 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1347 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18817] An enzyme complex designated DICER COMPLEX, dices the VGAM1347 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1347 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1347 RNA is designated SEQ ID:4058, and is provided hereinbelow with reference to the sequence listing part.

[18818] VGAM1347 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1347 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1347 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18819] VGAM1347 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1347 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1347 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1347 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1347 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18820] The complementary binding of VGAM1347 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1347 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1347 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1347 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18821] It is appreciated that VGAM1347 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1347 host target genes. The mRNA of each one of this plurality of VGAM1347 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1347 RNA, herein designated VGAM RNA, and which when bound by VGAM1347 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1347 host target proteins.

[18822] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1347 gene, herein designated VGAM GENE, on one or more VGAM1347 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18823] It is yet further appreciated that a function of VGAM1347 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1347 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM1347 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM1347 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18824] Nucleotide sequences of the VGAM1347 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1347 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1347 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1347 are further described hereinbelow with reference to Table 1.

[18825] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1347 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18826] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1348 (VGAM1348) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[18827] VGAM1348 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1348 was detected is described hereinabove with reference to Figs. 2–8.

[18828] VGAM1348 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM1348 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18829] VGAM1348 gene, herein designated VGAM GENE, encodes a VGAM1348 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1348 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1348 precursor RNA is designated SEQ ID:1334, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1334 is located at position 254555 relative to the genome of Fowlpox virus.

[18830] VGAM1348 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1348 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18831] An enzyme complex designated DICER COMPLEX, dices the VGAM1348 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1348 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1348 RNA is designated SEQ ID:4059, and is provided hereinbelow with reference to the sequence listing part.

[18832] VGAM1348 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1348 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1348 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18833] VGAM1348 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1348 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1348 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1348 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1348 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18834] The complementary binding of VGAM1348 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1348 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1348 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1348 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18835] It is appreciated that VGAM1348 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1348 host target genes. The mRNA of each one of this plurality of VGAM1348 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1348 RNA, herein designated VGAM RNA, and which when bound by VGAM1348 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1348 host target proteins.

[18836] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1348 gene, herein designated VGAM GENE, on one or more VGAM1348 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18837] It is yet further appreciated that a function of VGAM1348 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1348 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific

functions, and accordingly utilities, of VGAM1348 correlate with, and may be deduced from, the identity of the host target genes which VGAM1348 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18838] Nucleotide sequences of the VGAM1348 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1348 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1348 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1348 are further described hereinbelow with reference to Table 1.

[18839] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1348 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18840] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1349 (VGAM1349) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[18841] VGAM1349 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1349 was detected is described hereinabove with reference to Figs. 2–8.

[18842] VGAM1349 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM1349 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18843] VGAM1349 gene, herein designated VGAM GENE, encodes a VGAM1349 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1349 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1349 precursor RNA is designated SEQ ID:1335, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1335 is located at position 252237 relative to the genome of Fowlpox virus.

[18844] VGAM1349 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1349 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18845] An enzyme complex designated DICER COMPLEX, dices the VGAM1349 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1349 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1349 RNA is designated SEQ ID:4060, and is provided hereinbelow with reference to the sequence listing part.

[18846] VGAM1349 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1349 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1349 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18847] VGAM1349 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1349 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1349 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1349 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1349 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18848] The complementary binding of VGAM1349 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1349 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1349 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1349 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18849] It is appreciated that VGAM1349 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1349 host target genes. The mRNA of each one of this plurality of VGAM1349 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1349 RNA, herein designated VGAM RNA, and which when bound by VGAM1349 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1349 host target proteins.

[18850] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1349 gene, herein designated VGAM GENE, on one or more VGAM1349 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18851] It is yet further appreciated that a function of VGAM1349 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1349 include diagnosis, prevention and

treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM1349 correlate with, and may be deduced from, the identity of the host target genes which VGAM1349 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18852] Nucleotide sequences of the VGAM1349 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1349 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1349 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1349 are further described hereinbelow with reference to Table 1.

[18853] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1349 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18854] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1350 (VGAM1350) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18855] VGAM1350 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1350 was detected is described hereinabove with reference to Figs. 2–8.

[18856] VGAM1350 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM1350 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18857] VGAM1350 gene, herein designated VGAM GENE, encodes a VGAM1350 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1350 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1350 precursor RNA is designated SEQ ID:1336, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1336 is located at position 254693 relative to the genome of Fowlpox virus.

[18858] VGAM1350 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1350 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18859] An enzyme complex designated DICER COMPLEX, dices the VGAM1350 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1350 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM1350 RNA is designated SEQ ID:4061, and is provided hereinbelow with reference to the sequence listing part.

[18860] VGAM1350 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1350 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1350 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18861] VGAM1350 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1350 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1350 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1350 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1350 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18862] The complementary binding of VGAM1350 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1350 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1350 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1350 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18863] It is appreciated that VGAM1350 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1350 host target genes. The mRNA of each one of this plurality of VGAM1350 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1350 RNA, herein designated VGAM

RNA, and which when bound by VGAM1350 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1350 host target proteins.

[18864] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1350 gene, herein designated VGAM GENE, on one or more VGAM1350 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18865] It is yet further appreciated that a function of VGAM1350 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1350 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM1350 correlate with, and may be deduced from, the identity of the host target genes which VGAM1350 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18866] Nucleotide sequences of the VGAM1350 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1350 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1350 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1350 are further described hereinbelow with reference to Table 1.

[18867] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1350 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18868] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1351 (VGAM1351) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18869] VGAM1351 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1351 was detected is described hereinabove with reference to Figs. 2-8.

[18870] VGAM1351 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM1351 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18871] VGAM1351 gene, herein designated VGAM GENE, encodes a VGAM1351 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1351 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1351 precursor RNA is designated SEQ ID:1337, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1337 is located at position

252589 relative to the genome of Fowlpox virus.

[18872] VGAM1351 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1351 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18873] An enzyme complex designated DICER COMPLEX, dices the VGAM1351 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1351 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM1351 RNA is designated SEQ ID:4062, and is provided hereinbelow with reference to the sequence listing part.

[18874] VGAM1351 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1351 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1351 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18875] VGAM1351 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1351 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1351 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1351 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1351 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18876] The complementary binding of VGAM1351 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1351 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1351 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1351 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18877] It is appreciated that VGAM1351 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1351 host target genes. The mRNA of each one of this plurality of VGAM1351 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1351 RNA, herein designated VGAM RNA, and which when bound by VGAM1351 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1351 host target proteins.

[18878] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1351 gene, herein designated VGAM GENE, on one or more VGAM1351 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18879] It is yet further appreciated that a function of VGAM1351 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1351 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM1351 correlate with, and may be deduced from, the identity of the host target genes which VGAM1351 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18880] Nucleotide sequences of the VGAM1351 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1351 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1351 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1351 are further described hereinbelow with reference to Table 1.

[18881] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1351 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18882] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1352 (VGAM1352) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18883] VGAM1352 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1352 was detected is described hereinabove with reference to Figs. 2–8.

[18884] VGAM1352 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM1352 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18885] VGAM1352 gene, herein designated VGAM GENE, encodes a VGAM1352 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1352 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1352 precursor RNA is designated SEQ ID:1338, and is provided hereinbelow with reference to the sequence listing part. Nu–

cleotide sequence SEQ ID:1338 is located at position 252917 relative to the genome of Fowlpox virus.

[18886] VGAM1352 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1352 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18887] An enzyme complex designated DICER COMPLEX, dices the VGAM1352 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1352 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1352 RNA is designated SEQ ID:4063, and is provided hereinbelow with reference to the sequence

listing part.

[18888] VGAM1352 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1352 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1352 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18889] VGAM1352 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1352 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1352 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1352 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1352 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18890] The complementary binding of VGAM1352 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1352 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1352 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1352 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18891] It is appreciated that VGAM1352 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1352 host target genes. The mRNA of each one of this plurality of VGAM1352 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1352 RNA, herein designated VGAM RNA, and which when bound by VGAM1352 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1352 host target proteins.

[18892] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1352 gene, herein designated VGAM GENE, on one or more VGAM1352 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18893] It is yet further appreciated that a function of VGAM1352

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1352 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM1352 correlate with, and may be deduced from, the identity of the host target genes which VGAM1352 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18894] Nucleotide sequences of the VGAM1352 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1352 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1352 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1352 are further described hereinbelow with reference to Table 1.

[18895] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1352 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18896] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1353 (VGAM1353) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18897] VGAM1353 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1353 was detected is described hereinabove with reference to Figs. 2–8.

[18898] VGAM1353 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM1353 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18899] VGAM1353 gene, herein designated VGAM GENE, encodes a VGAM1353 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1353 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1353 precursor RNA is designated SEQ ID:1339, and is provided here–

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1339 is located at position 251158 relative to the genome of Fowlpox virus.

[18900] VGAM1353 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1353 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18901] An enzyme complex designated DICER COMPLEX, dices the VGAM1353 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1353 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM1353 RNA is designated SEQ ID:4064, and

is provided hereinbelow with reference to the sequence listing part.

[18902] VGAM1353 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1353 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1353 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18903] VGAM1353 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1353 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1353 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1353 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1353 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18904] The complementary binding of VGAM1353 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1353 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1353 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1353 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18905] It is appreciated that VGAM1353 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1353 host target genes. The mRNA of each one of this plurality of VGAM1353 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1353 RNA, herein designated VGAM RNA, and which when bound by VGAM1353 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1353 host target proteins.

[18906] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1353 gene, herein designated VGAM GENE, on one or more VGAM1353 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18907] It is yet further appreciated that a function of VGAM1353 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1353 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM1353 correlate with, and may be deduced from, the identity of the host target genes which VGAM1353 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18908] Nucleotide sequences of the VGAM1353 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM1353 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1353 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1353 are further described hereinbelow with reference to Table 1.

[18909] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1353 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18910] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1354 (VGAM1354) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18911] VGAM1354 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1354 was detected is described hereinabove with reference to Figs. 2–8.

[18912] VGAM1354 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma virus. VGAM1354 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18913] VGAM1354 gene, herein designated VGAM GENE, encodes a VGAM1354 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1354 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1354 precu-

sor RNA is designated SEQ ID:1340, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1340 is located at position 7412 relative to the genome of Triatoma virus.

[18914] VGAM1354 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1354 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18915] An enzyme complex designated DICER COMPLEX, dices the VGAM1354 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1354 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide se-

quence of VGAM1354 RNA is designated SEQ ID:4065, and is provided hereinbelow with reference to the sequence listing part.

[18916] VGAM1354 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1354 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1354 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18917] VGAM1354 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1354 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1354 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1354 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1354 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18918] The complementary binding of VGAM1354 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1354 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1354 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1354 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18919] It is appreciated that VGAM1354 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1354 host target genes. The mRNA of

each one of this plurality of VGAM1354 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1354 RNA, herein designated VGAM RNA, and which when bound by VGAM1354 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1354 host target proteins.

[18920] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1354 gene, herein designated VGAM GENE, on one or more VGAM1354 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[18921] It is yet further appreciated that a function of VGAM1354 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1354 include diagnosis, prevention and treatment of viral infection by Triatoma virus. Specific functions, and accordingly utilities, of VGAM1354 correlate with, and may be deduced from, the identity of the host target genes which VGAM1354 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18922] Nucleotide sequences of the VGAM1354 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1354 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1354 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1354 are further described hereinbelow with reference to Table 1.

[18923] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1354 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[18924] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1355 (VGAM1355) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18925] VGAM1355 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1355 was detected is described hereinabove with reference to Figs. 2–8.

[18926] VGAM1355 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma virus. VGAM1355 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18927] VGAM1355 gene, herein designated VGAM GENE, encodes a VGAM1355 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1355 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1355 precursor RNA is designated SEQ ID:1341, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1341 is located at position 3387 relative to the genome of Triatoma virus.

[18928] VGAM1355 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1355 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18929] An enzyme complex designated DICER COMPLEX, dices the VGAM1355 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1355 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1355 RNA is designated SEQ ID:4066, and is provided hereinbelow with reference to the sequence listing part.

[18930] VGAM1355 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1355 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1355 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18931] VGAM1355 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1355 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1355 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1355 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1355 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18932] The complementary binding of VGAM1355 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1355 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1355 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1355 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18933] It is appreciated that VGAM1355 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1355 host target genes. The mRNA of each one of this plurality of VGAM1355 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1355 RNA, herein designated VGAM RNA, and which when bound by VGAM1355 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1355 host target proteins.

[18934] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1355 gene, herein designated VGAM GENE, on one or more VGAM1355 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[18935] It is yet further appreciated that a function of VGAM1355 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1355 include diagnosis, prevention and treatment of viral infection by Triatoma virus. Specific functions, and accordingly utilities, of VGAM1355 correlate with, and may be deduced from, the identity of the host target genes which VGAM1355 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18936] Nucleotide sequences of the VGAM1355 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1355 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1355 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1355 are further described hereinbelow with reference to Table 1.

[18937] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1355 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18938] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1356 (VGAM1356) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18939] VGAM1356 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1356 was detected is described hereinabove with reference to Figs. 2-8.

[18940] VGAM1356 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma virus.

VGAM1356 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18941] VGAM1356 gene, herein designated VGAM GENE, encodes a VGAM1356 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1356 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1356 precursor RNA is designated SEQ ID:1342, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1342 is located at position 7993 relative to the genome of Triatoma virus.

[18942] VGAM1356 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1356 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18943] An enzyme complex designated DICER COMPLEX, dices the VGAM1356 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1356 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1356 RNA is designated SEQ ID:4067, and is provided hereinbelow with reference to the sequence listing part.

[18944] VGAM1356 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1356 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1356 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18945] VGAM1356 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1356 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1356 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1356 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1356 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18946] The complementary binding of VGAM1356 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1356 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1356 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1356 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18947] It is appreciated that VGAM1356 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1356 host target genes. The mRNA of each one of this plurality of VGAM1356 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1356 RNA, herein designated VGAM RNA, and which when bound by VGAM1356 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1356 host target proteins.

[18948] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1356 gene, herein designated VGAM GENE, on one or more VGAM1356 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18949] It is yet further appreciated that a function of VGAM1356 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1356 include diagnosis, prevention and treatment of viral infection by Triatoma virus. Specific functions, and accordingly utilities, of VGAM1356 correlate with, and may be deduced from, the identity of the host target genes which VGAM1356 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18950] Nucleotide sequences of the VGAM1356 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1356 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1356 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1356 are further described hereinbelow with reference to Table 1.

[18951] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1356 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18952] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1357 (VGAM1357) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18953] VGAM1357 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1357 was detected is described hereinabove with reference to Figs. 2–8.

[18954] VGAM1357 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma virus.

VGAM1357 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18955] VGAM1357 gene, herein designated VGAM GENE, encodes a VGAM1357 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1357 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1357 precursor RNA is designated SEQ ID:1343, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1343 is located at position 7136 relative to the genome of Triatoma virus.

[18956] VGAM1357 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1357 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18957] An enzyme complex designated DICER COMPLEX, dices the VGAM1357 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1357 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1357 RNA is designated SEQ ID:4068, and is provided hereinbelow with reference to the sequence listing part.

[18958] VGAM1357 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1357 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1357 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18959] VGAM1357 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1357 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1357 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1357 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1357 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18960] The complementary binding of VGAM1357 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1357 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1357 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1357 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18961] It is appreciated that VGAM1357 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1357 host target genes. The mRNA of each one of this plurality of VGAM1357 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1357 RNA, herein designated VGAM RNA, and which when bound by VGAM1357 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1357 host target proteins.

[18962] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1357 gene, herein designated VGAM GENE, on one or more VGAM1357 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18963] It is yet further appreciated that a function of VGAM1357 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1357 include diagnosis, prevention and treatment of viral infection by Triatoma virus. Specific functions, and accordingly utilities, of VGAM1357 correlate with, and may be deduced from, the identity of the host target genes which VGAM1357 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18964] Nucleotide sequences of the VGAM1357 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1357 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1357 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1357 are further described hereinbelow with reference to Table 1.

[18965] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1357 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18966] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1358 (VGAM1358) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18967] VGAM1358 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1358 was detected is described hereinabove with reference to Figs. 2-8.

[18968] VGAM1358 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma virus.

VGAM1358 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18969] VGAM1358 gene, herein designated VGAM GENE, encodes a VGAM1358 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1358 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1358 precursor RNA is designated SEQ ID:1344, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1344 is located at position 8558 relative to the genome of Triatoma virus.

[18970] VGAM1358 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1358 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18971] An enzyme complex designated DICER COMPLEX, dices the VGAM1358 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1358 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1358 RNA is designated SEQ ID:4069, and is provided hereinbelow with reference to the sequence listing part.

[18972] VGAM1358 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1358 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1358 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18973] VGAM1358 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1358 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1358 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1358 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1358 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18974] The complementary binding of VGAM1358 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1358 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1358 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1358 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[18975] It is appreciated that VGAM1358 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1358 host target genes. The mRNA of each one of this plurality of VGAM1358 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1358 RNA, herein designated VGAM RNA, and which when bound by VGAM1358 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1358 host target proteins.

[18976] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1358 gene, herein designated VGAM GENE, on one or more VGAM1358 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18977] It is yet further appreciated that a function of VGAM1358 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1358 include diagnosis, prevention and treatment of viral infection by Triatoma virus. Specific functions, and accordingly utilities, of VGAM1358 correlate with, and may be deduced from, the identity of the host target genes which VGAM1358 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18978] Nucleotide sequences of the VGAM1358 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1358 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1358 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1358 are further described hereinbelow with reference to Table 1.

[18979] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1358 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18980] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1359 (VGAM1359) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18981] VGAM1359 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1359 was detected is described hereinabove with reference to Figs. 2-8.

[18982] VGAM1359 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma virus. VGAM1359 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18983] VGAM1359 gene, herein designated VGAM GENE, encodes a VGAM1359 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1359 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1359 precursor RNA is designated SEQ ID:1345, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1345 is located at position 2393 relative to the genome of Triatoma virus.

[18984] VGAM1359 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1359 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18985] An enzyme complex designated DICER COMPLEX, dices the VGAM1359 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1359 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM1359 RNA is designated SEQ ID:4070, and is provided hereinbelow with reference to the sequence listing part.

[18986] VGAM1359 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1359 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1359 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[18987] VGAM1359 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1359 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1359 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1359 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1359 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[18988] The complementary binding of VGAM1359 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1359 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1359 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1359 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18989] It is appreciated that VGAM1359 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1359 host target genes. The mRNA of each one of this plurality of VGAM1359 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1359 RNA, herein designated VGAM RNA, and which when bound by VGAM1359 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1359 host target proteins.

[18990] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1359 gene, herein designated VGAM GENE, on one or more VGAM1359 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[18991] It is yet further appreciated that a function of VGAM1359 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1359 include diagnosis, prevention and treatment of viral infection by Triatoma virus. Specific functions, and accordingly utilities, of VGAM1359 correlate with, and may be deduced from, the identity of the host target genes which VGAM1359 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18992] Nucleotide sequences of the VGAM1359 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1359 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1359 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1359 are further described hereinbelow with reference to Table 1.

[18993] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1359 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18994] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1360 (VGAM1360) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18995] VGAM1360 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1360 was detected is described hereinabove with reference to Figs. 2-8.

[18996] VGAM1360 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma virus. VGAM1360 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18997] VGAM1360 gene, herein designated VGAM GENE, encodes

a VGAM1360 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1360 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1360 precursor RNA is designated SEQ ID:1346, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1346 is located at position 6392 relative to the genome of Triatoma virus.

[18998] VGAM1360 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1360 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18999] An enzyme complex designated DICER COMPLEX, dices the VGAM1360 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1360 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1360 RNA is designated SEQ ID:4071, and is provided hereinbelow with reference to the sequence listing part.

[19000] VGAM1360 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1360 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1360 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19001] VGAM1360 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1360 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1360 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1360 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1360 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19002] The complementary binding of VGAM1360 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1360 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1360 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1360 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19003] It is appreciated that VGAM1360 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1360 host target genes. The mRNA of each one of this plurality of VGAM1360 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1360 RNA, herein designated VGAM RNA, and which when bound by VGAM1360 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1360 host target proteins.

[19004] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1360 gene, herein designated VGAM GENE, on one or more VGAM1360 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19005] It is yet further appreciated that a function of VGAM1360 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1360 include diagnosis, prevention and treatment of viral infection by Triatoma virus. Specific functions, and accordingly utilities, of VGAM1360 correlate with, and may be deduced from, the identity of the host target genes which VGAM1360 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19006] Nucleotide sequences of the VGAM1360 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM1360 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1360 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1360 are further

described hereinbelow with reference to Table 1.

[19007] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1360 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19008] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1361 (VGAM1361) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19009] VGAM1361 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1361 was detected is described hereinabove with reference to Figs. 2-8.

[19010] VGAM1361 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma virus. VGAM1361 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19011] VGAM1361 gene, herein designated VGAM GENE, encodes a VGAM1361 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1361 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1361 precursor RNA is designated SEQ ID:1347, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1347 is located at position 5836 relative to the genome of Triatoma virus.

[19012] VGAM1361 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1361 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19013] An enzyme complex designated DICER COMPLEX, dices the VGAM1361 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1361 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1361 RNA is designated SEQ ID:4072, and is provided hereinbelow with reference to the sequence listing part.

[19014] VGAM1361 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1361 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1361 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19015] VGAM1361 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1361 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1361 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1361 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1361 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19016] The complementary binding of VGAM1361 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1361 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1361

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1361 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19017] It is appreciated that VGAM1361 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1361 host target genes. The mRNA of each one of this plurality of VGAM1361 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1361 RNA, herein designated VGAM RNA, and which when bound by VGAM1361 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1361 host target proteins.

[19018] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1361 gene, herein designated VGAM GENE, on one or more VGAM1361 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19019] It is yet further appreciated that a function of VGAM1361 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1361 include diagnosis, prevention and treatment of viral infection by Triatoma virus. Specific functions, and accordingly utilities, of VGAM1361 correlate with, and may be deduced from, the identity of the host target genes which VGAM1361 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19020] Nucleotide sequences of the VGAM1361 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1361 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1361 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1361 are further described hereinbelow with reference to Table 1.

[19021] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1361 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19022] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1362 (VGAM1362) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19023] VGAM1362 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1362 was detected is described hereinabove with reference to Figs. 2-8.

[19024] VGAM1362 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Duck adenovirus 1. VGAM1362 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[19025] VGAM1362 gene, herein designated VGAM GENE, encodes a VGAM1362 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1362 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1362 precursor RNA is designated SEQ ID:1348, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1348 is located at position 12491 relative to the genome of Duck adenovirus 1.

[19026] VGAM1362 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1362 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19027] An enzyme complex designated DICER COMPLEX, dices

the VGAM1362 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1362 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1362 RNA is designated SEQ ID:4073, and is provided hereinbelow with reference to the sequence listing part.

[19028] VGAM1362 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1362 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1362 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19029] VGAM1362 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1362 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1362 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1362 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1362 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19030] The complementary binding of VGAM1362 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1362 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1362 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1362 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19031] It is appreciated that VGAM1362 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1362 host target genes. The mRNA of each one of this plurality of VGAM1362 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1362 RNA, herein designated VGAM RNA, and which when bound by VGAM1362 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1362 host target proteins.

[19032] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1362 gene, herein designated VGAM GENE, on one or more VGAM1362 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19033] It is yet further appreciated that a function of VGAM1362 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1362 include diagnosis, prevention and treatment of viral infection by Duck adenovirus 1. Specific functions, and accordingly utilities, of VGAM1362 correlate with, and may be deduced from, the identity of the host target genes which VGAM1362 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19034] Nucleotide sequences of the VGAM1362 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1362 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1362 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1362 are further described hereinbelow with reference to Table 1.

[19035] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1362 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19036] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1363 (VGAM1363) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19037] VGAM1363 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1363 was detected is described hereinabove with reference to Figs. 2-8.

[19038] VGAM1363 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Duck adenovirus 1. VGAM1363 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[19039] VGAM1363 gene, herein designated VGAM GENE, encodes a VGAM1363 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1363 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1363 precursor RNA is designated SEQ ID:1349, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1349 is located at position 14923 relative to the genome of Duck adenovirus 1.

[19040] VGAM1363 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1363 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19041] An enzyme complex designated DICER COMPLEX, dices the VGAM1363 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1363 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM1363 RNA is designated SEQ ID:4074, and is provided hereinbelow with reference to the sequence listing part.

[19042] VGAM1363 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1363 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1363 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19043] VGAM1363 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1363 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1363 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1363 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1363 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19044] The complementary binding of VGAM1363 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1363 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1363 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1363 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19045] It is appreciated that VGAM1363 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1363 host target genes. The mRNA of each one of this plurality of VGAM1363 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1363 RNA, herein designated VGAM RNA, and which when bound by VGAM1363 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1363 host target proteins.

[19046] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1363 gene, herein designated VGAM GENE, on one or more VGAM1363 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19047] It is yet further appreciated that a function of VGAM1363 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1363 include diagnosis, prevention and treatment of viral infection by Duck adenovirus 1. Specific functions, and accordingly utilities, of VGAM1363 correlate with, and may be deduced from, the identity of the host target genes which VGAM1363 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19048] Nucleotide sequences of the VGAM1363 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1363 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1363 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1363 are further described hereinbelow with reference to Table 1.

[19049] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1363 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19050] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1364 (VGAM1364) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19051] VGAM1364 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1364 was detected is described hereinabove with reference to Figs. 2-8.

[19052] VGAM1364 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Duck adenovirus 1.

VGAM1364 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19053] VGAM1364 gene, herein designated VGAM GENE, encodes a VGAM1364 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1364 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1364 precursor RNA is designated SEQ ID:1350, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1350 is located at position 14767 relative to the genome of Duck adenovirus 1.

[19054] VGAM1364 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1364 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[19055] An enzyme complex designated DICER COMPLEX, dices the VGAM1364 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1364 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1364 RNA is designated SEQ ID:4075, and is provided hereinbelow with reference to the sequence listing part.

[19056] VGAM1364 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1364 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1364 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19057] VGAM1364 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1364 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1364 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1364 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1364 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19058] The complementary binding of VGAM1364 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1364 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1364 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1364 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19059] It is appreciated that VGAM1364 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1364 host target genes. The mRNA of each one of this plurality of VGAM1364 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1364 RNA, herein designated VGAM RNA, and which when bound by VGAM1364 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1364 host target proteins.

[19060] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1364 gene, herein designated VGAM GENE, on one or more VGAM1364 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19061] It is yet further appreciated that a function of VGAM1364 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1364 include diagnosis, prevention and treatment of viral infection by Duck adenovirus 1. Specific functions, and accordingly utilities, of VGAM1364 correlate with, and may be deduced from, the identity of the host target genes which VGAM1364 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19062] Nucleotide sequences of the VGAM1364 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1364 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1364 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1364 are further described hereinbelow with reference to Table 1.

[19063] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1364 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19064] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1365 (VGAM1365) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19065] VGAM1365 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1365 was detected is described hereinabove with reference to Figs. 2-8.

[19066] VGAM1365 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Duck adenovirus 1. VGAM1365 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19067] VGAM1365 gene, herein designated VGAM GENE, encodes a VGAM1365 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1365 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1365 precursor RNA is designated SEQ ID:1351, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1351 is located at position 10633 relative to the genome of Duck adenovirus 1.

[19068] VGAM1365 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1365 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19069] An enzyme complex designated DICER COMPLEX, dices the VGAM1365 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1365 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 93%) nucleotide sequence of VGAM1365 RNA is designated SEQ ID:4076, and is provided hereinbelow with reference to the sequence listing part.

[19070] VGAM1365 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1365 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1365 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19071] VGAM1365 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1365 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1365 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1365 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1365 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19072] The complementary binding of VGAM1365 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1365 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1365 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1365 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19073] It is appreciated that VGAM1365 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1365 host target genes. The mRNA of each one of this plurality of VGAM1365 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1365 RNA, herein designated VGAM RNA, and which when bound by VGAM1365 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1365 host target proteins.

[19074] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1365 gene, herein designated VGAM GENE, on one or more VGAM1365 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19075] It is yet further appreciated that a function of VGAM1365 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1365 include diagnosis, prevention and treatment of viral infection by Duck adenovirus 1. Specific functions, and accordingly utilities, of VGAM1365 correlate with, and may be deduced from, the identity of the host target genes which VGAM1365 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19076] Nucleotide sequences of the VGAM1365 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1365 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1365 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1365 are further described hereinbelow with reference to Table 1.

[19077] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1365 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19078] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1366 (VGAM1366) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19079] VGAM1366 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1366 was detected is described hereinabove with reference to Figs. 2-8.

[19080] VGAM1366 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 6. VGAM1366 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19081] VGAM1366 gene, herein designated VGAM GENE, encodes a VGAM1366 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1366 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1366 precursor RNA is designated SEQ ID:1352, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1352 is located at position 50024 relative to the genome of Human herpesvirus 6.

[19082] VGAM1366 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1366 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19083] An enzyme complex designated DICER COMPLEX, dices the VGAM1366 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1366 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1366 RNA is designated SEQ ID:4077, and is provided hereinbelow with reference to the sequence listing part.

[19084] VGAM1366 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1366 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1366 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[19085] VGAM1366 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1366 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1366 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1366 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1366 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19086] The complementary binding of VGAM1366 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1366 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1366 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1366 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19087] It is appreciated that VGAM1366 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1366 host target genes. The mRNA of each one of this plurality of VGAM1366 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1366 RNA, herein designated VGAM RNA, and which when bound by VGAM1366 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1366 host target proteins.

[19088] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1366 gene, herein designated VGAM GENE, on one

or more VGAM1366 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19089] It is yet further appreciated that a function of VGAM1366 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1366 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 6. Specific functions, and accordingly utilities, of VGAM1366 correlate with, and may be deduced from, the identity of the host target genes which VGAM1366 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19090] Nucleotide sequences of the VGAM1366 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1366 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1366 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1366 are further described hereinbelow with reference to Table 1.

[19091] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1366 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19092] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1367 (VGAM1367) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19093] VGAM1367 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1367 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[19094] VGAM1367 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 6. VGAM1367 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19095] VGAM1367 gene, herein designated VGAM GENE, encodes a VGAM1367 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1367 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1367 precursor RNA is designated SEQ ID:1353, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1353 is located at position 48800 relative to the genome of Human herpesvirus 6.

[19096] VGAM1367 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1367 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19097] An enzyme complex designated DICER COMPLEX, dices the VGAM1367 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1367 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM1367 RNA is designated SEQ ID:4078, and is provided hereinbelow with reference to the sequence listing part.

[19098] VGAM1367 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1367 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1367 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19099] VGAM1367 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1367 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1367 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1367 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1367 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[19100] The complementary binding of VGAM1367 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1367 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1367 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1367 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19101] It is appreciated that VGAM1367 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1367 host target genes. The mRNA of each one of this plurality of VGAM1367 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1367 RNA, herein designated VGAM RNA, and which when bound by VGAM1367 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1367 host target proteins.

[19102] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1367 gene, herein designated VGAM GENE, on one or more VGAM1367 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19103] It is yet further appreciated that a function of VGAM1367 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1367 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 6. Specific functions, and accordingly utilities, of VGAM1367 correlate with, and may be deduced from, the identity of the host target genes which VGAM1367 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[19104] Nucleotide sequences of the VGAM1367 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1367 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1367 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1367 are further described hereinbelow with reference to Table 1.

[19105] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1367 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19106] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1368 (VGAM1368) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19107] VGAM1368 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1368 was detected is described hereinabove with reference to Figs. 2–8.

[19108] VGAM1368 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 6.

VGAM1368 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19109] VGAM1368 gene, herein designated VGAM GENE, encodes a VGAM1368 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1368 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1368 precursor RNA is designated SEQ ID:1354, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1354 is located at position 44241 relative to the genome of Human herpesvirus 6.

[19110] VGAM1368 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1368 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19111] An enzyme complex designated DICER COMPLEX, dices the VGAM1368 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1368 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM1368 RNA is designated SEQ ID:4079, and is provided hereinbelow with reference to the sequence listing part.

[19112] VGAM1368 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1368 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1368 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19113] VGAM1368 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1368 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1368 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1368 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1368 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19114] The complementary binding of VGAM1368 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1368 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1368 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1368 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19115] It is appreciated that VGAM1368 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1368 host target genes. The mRNA of each one of this plurality of VGAM1368 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1368 RNA, herein designated VGAM RNA, and which when bound by VGAM1368 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1368 host target proteins.

[19116] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1368 gene, herein designated VGAM GENE, on one or more VGAM1368 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19117] It is yet further appreciated that a function of VGAM1368 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1368 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 6. Specific functions, and accordingly utilities, of VGAM1368 correlate with, and may be deduced from, the identity of the host target genes which VGAM1368 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[19118] Nucleotide sequences of the VGAM1368 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1368 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1368 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1368 are further described hereinbelow with reference to Table 1.

[19119] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1368 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19120] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1369 (VGAM1369) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19121] VGAM1369 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1369 was detected is described hereinabove with reference to Figs. 2–8.

[19122] VGAM1369 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 6. VGAM1369 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19123] VGAM1369 gene, herein designated VGAM GENE, encodes a VGAM1369 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1369 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1369 precursor RNA is designated SEQ ID:1355, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1355 is located at position 50681 relative to the genome of Human herpesvirus 6.

[19124] VGAM1369 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1369 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19125] An enzyme complex designated DICER COMPLEX, dices the VGAM1369 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1369 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM1369 RNA is designated SEQ ID:4080, and is provided hereinbelow with reference to the sequence listing part.

[19126] VGAM1369 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1369 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1369 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19127] VGAM1369 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1369 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1369 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1369 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1369 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19128] The complementary binding of VGAM1369 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1369 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1369 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1369 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19129] It is appreciated that VGAM1369 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1369 host target genes. The mRNA of each one of this plurality of VGAM1369 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1369 RNA, herein designated VGAM RNA, and which when bound by VGAM1369 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1369 host target proteins.

[19130] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1369 gene, herein designated VGAM GENE, on one or more VGAM1369 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19131] It is yet further appreciated that a function of VGAM1369 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1369 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 6. Specific functions, and accordingly utilities, of VGAM1369 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1369 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19132] Nucleotide sequences of the VGAM1369 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1369 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1369 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1369 are further described hereinbelow with reference to Table 1.

[19133] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1369 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19134] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1370 (VGAM1370) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19135] VGAM1370 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1370 was detected is described hereinabove with reference to Figs. 2–8.

[19136] VGAM1370 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 6. VGAM1370 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19137] VGAM1370 gene, herein designated VGAM GENE, encodes a VGAM1370 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1370 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1370 precursor RNA is designated SEQ ID:1356, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1356 is located at position 50239 relative to the genome of Human herpesvirus 6.

[19138] VGAM1370 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1370 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19139] An enzyme complex designated DICER COMPLEX, dices the VGAM1370 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1370 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1370 RNA is designated SEQ ID:4081, and is provided hereinbelow with reference to the sequence listing part.

[19140] VGAM1370 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1370 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1370 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19141] VGAM1370 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1370 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1370 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1370 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1370 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19142] The complementary binding of VGAM1370 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1370 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1370 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1370 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19143] It is appreciated that VGAM1370 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1370 host target genes. The mRNA of each one of this plurality of VGAM1370 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1370 RNA, herein designated VGAM RNA, and which when bound by VGAM1370 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1370 host target proteins.

[19144] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1370 gene, herein designated VGAM GENE, on one or more VGAM1370 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19145] It is yet further appreciated that a function of VGAM1370 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1370 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 6. Specific functions, and accordingly utilities, of VGAM1370

correlate with, and may be deduced from, the identity of the host target genes which VGAM1370 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19146] Nucleotide sequences of the VGAM1370 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1370 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1370 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1370 are further described hereinbelow with reference to Table 1.

[19147] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1370 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19148] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1371 (VGAM1371) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[19149] VGAM1371 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1371 was detected is described hereinabove with reference to Figs. 2–8.

[19150] VGAM1371 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 6. VGAM1371 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19151] VGAM1371 gene, herein designated VGAM GENE, encodes a VGAM1371 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1371 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1371 precursor RNA is designated SEQ ID:1357, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1357 is located at position 46060 relative to the genome of Human herpesvirus 6.

[19152] VGAM1371 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1371 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19153] An enzyme complex designated DICER COMPLEX, dices the VGAM1371 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1371 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM1371 RNA is designated SEQ ID:4082, and is provided hereinbelow with reference to the sequence listing part.

[19154] VGAM1371 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1371 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1371 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19155] VGAM1371 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1371 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1371 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1371 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1371 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19156] The complementary binding of VGAM1371 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1371 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1371 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1371 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19157] It is appreciated that VGAM1371 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1371 host target genes. The mRNA of each one of this plurality of VGAM1371 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1371 RNA, herein designated VGAM RNA, and which when bound by VGAM1371 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1371 host target proteins.

[19158] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1371 gene, herein designated VGAM GENE, on one or more VGAM1371 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19159] It is yet further appreciated that a function of VGAM1371 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1371 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 6. Spe-

cific functions, and accordingly utilities, of VGAM1371 correlate with, and may be deduced from, the identity of the host target genes which VGAM1371 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19160] Nucleotide sequences of the VGAM1371 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1371 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1371 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1371 are further described hereinbelow with reference to Table 1.

[19161] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1371 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19162] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1372 (VGAM1372) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[19163] VGAM1372 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1372 was detected is described hereinabove with reference to Figs. 2–8.

[19164] VGAM1372 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM1372 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19165] VGAM1372 gene, herein designated VGAM GENE, encodes a VGAM1372 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1372 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1372 precursor RNA is designated SEQ ID:1358, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1358 is located at position 29852 relative to the genome of Alcelaphine herpesvirus 1.

[19166] VGAM1372 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1372 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19167] An enzyme complex designated DICER COMPLEX, dices the VGAM1372 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1372 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1372 RNA is designated SEQ ID:4083, and is provided hereinbelow with reference to the sequence listing part.

[19168] VGAM1372 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1372 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1372 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19169] VGAM1372 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1372 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1372 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1372 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1372 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19170] The complementary binding of VGAM1372 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1372 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1372 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1372 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19171] It is appreciated that VGAM1372 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1372 host target genes. The mRNA of each one of this plurality of VGAM1372 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1372 RNA, herein designated VGAM

RNA, and which when bound by VGAM1372 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1372 host target proteins.

[19172] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1372 gene, herein designated VGAM GENE, on one or more VGAM1372 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19173] It is yet further appreciated that a function of VGAM1372 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1372 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1372 correlate with, and may be deduced from, the identity of the host target genes which VGAM1372 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19174] Nucleotide sequences of the VGAM1372 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1372 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1372 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1372 are further described hereinbelow with reference to Table 1.

[19175] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1372 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19176] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1373 (VGAM1373) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19177] VGAM1373 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1373 was detected is described hereinabove with reference to Figs. 2-8.

[19178] VGAM1373 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM1373 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19179] VGAM1373 gene, herein designated VGAM GENE, encodes a VGAM1373 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1373 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1373 precursor RNA is designated SEQ ID:1359, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1359 is located at position

26710 relative to the genome of Alcelaphine herpesvirus 1.

[19180] VGAM1373 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1373 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19181] An enzyme complex designated DICER COMPLEX, dices the VGAM1373 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1373 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1373 RNA is designated SEQ ID:4084, and is provided hereinbelow with reference to the sequence

listing part.

[19182] VGAM1373 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1373 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1373 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19183] VGAM1373 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1373 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1373 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1373 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1373 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19184] The complementary binding of VGAM1373 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1373 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1373 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1373 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19185] It is appreciated that VGAM1373 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1373 host target genes. The mRNA of each one of this plurality of VGAM1373 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1373 RNA, herein designated VGAM RNA, and which when bound by VGAM1373 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1373 host target proteins.

[19186] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1373 gene, herein designated VGAM GENE, on one or more VGAM1373 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19187] It is yet further appreciated that a function of VGAM1373

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1373 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1373 correlate with, and may be deduced from, the identity of the host target genes which VGAM1373 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19188] Nucleotide sequences of the VGAM1373 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1373 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1373 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1373 are further described hereinbelow with reference to Table 1.

[19189] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1373 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19190] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1374 (VGAM1374) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19191] VGAM1374 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1374 was detected is described hereinabove with reference to Figs. 2–8.

[19192] VGAM1374 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM1374 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19193] VGAM1374 gene, herein designated VGAM GENE, encodes a VGAM1374 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1374 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1374 precursor RNA is designated SEQ ID:1360, and is provided here–

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1360 is located at position 27936 relative to the genome of Alcelaphine herpesvirus 1.

[19194] VGAM1374 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1374 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19195] An enzyme complex designated DICER COMPLEX, dices the VGAM1374 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1374 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide se-

quence of VGAM1374 RNA is designated SEQ ID:4085, and is provided hereinbelow with reference to the sequence listing part.

[19196] VGAM1374 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1374 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1374 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19197] VGAM1374 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1374 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1374 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1374 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1374 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19198] The complementary binding of VGAM1374 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1374 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1374 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1374 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19199] It is appreciated that VGAM1374 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1374 host target genes. The mRNA of

each one of this plurality of VGAM1374 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1374 RNA, herein designated VGAM RNA, and which when bound by VGAM1374 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1374 host target proteins.

[19200] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1374 gene, herein designated VGAM GENE, on one or more VGAM1374 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[19201] It is yet further appreciated that a function of VGAM1374 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1374 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1374 correlate with, and may be deduced from, the identity of the host target genes which VGAM1374 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19202] Nucleotide sequences of the VGAM1374 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1374 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1374 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1374 are further described hereinbelow with reference to Table 1.

[19203] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1374 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[19204] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1375 (VGAM1375) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19205] VGAM1375 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1375 was detected is described hereinabove with reference to Figs. 2–8.

[19206] VGAM1375 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM1375 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19207] VGAM1375 gene, herein designated VGAM GENE, encodes a VGAM1375 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1375 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1375 precursor RNA is designated SEQ ID:1361, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1361 is located at position 32330 relative to the genome of Alcelaphine herpesvirus 1.

[19208] VGAM1375 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1375 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19209] An enzyme complex designated DICER COMPLEX, dices the VGAM1375 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1375 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1375 RNA is designated SEQ ID:4086, and is provided hereinbelow with reference to the sequence listing part.

[19210] VGAM1375 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1375 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1375 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19211] VGAM1375 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1375 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1375 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1375 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1375 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19212] The complementary binding of VGAM1375 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1375 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1375 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1375 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19213] It is appreciated that VGAM1375 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1375 host target genes. The mRNA of each one of this plurality of VGAM1375 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1375 RNA, herein designated VGAM RNA, and which when bound by VGAM1375 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1375 host target proteins.

[19214] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1375 gene, herein designated VGAM GENE, on one or more VGAM1375 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19215] It is yet further appreciated that a function of VGAM1375 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1375 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1375 correlate with, and may be deduced from, the identity of the host target genes which VGAM1375 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19216] Nucleotide sequences of the VGAM1375 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1375 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1375 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1375 are further described hereinbelow with reference to Table 1.

[19217] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1375 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19218] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1376 (VGAM1376) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19219] VGAM1376 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1376 was detected is described hereinabove with reference to Figs. 2–8.

[19220] VGAM1376 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM1376 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19221] VGAM1376 gene, herein designated VGAM GENE, encodes a VGAM1376 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1376 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1376 precursor RNA is designated SEQ ID:1362, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1362 is located at position 28622 relative to the genome of Alcelaphine herpesvirus 1.

[19222] VGAM1376 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1376 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19223] An enzyme complex designated DICER COMPLEX, dices the VGAM1376 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1376 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1376 RNA is designated SEQ ID:4087, and is provided hereinbelow with reference to the sequence listing part.

[19224] VGAM1376 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1376 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1376 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19225] VGAM1376 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1376 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1376 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1376 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1376 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19226] The complementary binding of VGAM1376 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1376 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1376 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1376 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[19227] It is appreciated that VGAM1376 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1376 host target genes. The mRNA of each one of this plurality of VGAM1376 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1376 RNA, herein designated VGAM RNA, and which when bound by VGAM1376 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1376 host target proteins.

[19228] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1376 gene, herein designated VGAM GENE, on one or more VGAM1376 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19229] It is yet further appreciated that a function of VGAM1376 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1376 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1376 correlate with, and may be deduced from, the identity of the host target genes which VGAM1376 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19230] Nucleotide sequences of the VGAM1376 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1376 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1376 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1376 are further described hereinbelow with reference to Table 1.

[19231] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1376 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19232] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1377 (VGAM1377) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19233] VGAM1377 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1377 was detected is described hereinabove with reference to Figs. 2-8.

[19234] VGAM1377 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM1377 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19235] VGAM1377 gene, herein designated VGAM GENE, encodes a VGAM1377 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1377 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1377 precursor RNA is designated SEQ ID:1363, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1363 is located at position 27042 relative to the genome of Alcelaphine herpesvirus 1.

[19236] VGAM1377 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1377 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19237] An enzyme complex designated DICER COMPLEX, dices the VGAM1377 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1377 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1377 RNA is designated SEQ ID:4088, and is provided hereinbelow with reference to the sequence listing part.

[19238] VGAM1377 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1377 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1377 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19239] VGAM1377 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1377 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1377 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1377 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1377 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19240] The complementary binding of VGAM1377 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1377 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1377 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1377 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19241] It is appreciated that VGAM1377 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1377 host target genes. The mRNA of each one of this plurality of VGAM1377 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1377 RNA, herein designated VGAM RNA, and which when bound by VGAM1377 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1377 host target proteins.

[19242] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1377 gene, herein designated VGAM GENE, on one or more VGAM1377 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19243] It is yet further appreciated that a function of VGAM1377 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1377 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1377 correlate with, and may be deduced from, the identity of the host target genes which VGAM1377 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19244] Nucleotide sequences of the VGAM1377 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1377 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1377 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1377 are further

described hereinbelow with reference to Table 1.

[19245] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1377 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19246] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1378 (VGAM1378) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19247] VGAM1378 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1378 was detected is described hereinabove with reference to Figs. 2-8.

[19248] VGAM1378 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 1. VGAM1378 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19249] VGAM1378 gene, herein designated VGAM GENE, encodes a VGAM1378 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1378 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1378 precursor RNA is designated SEQ ID:1364, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1364 is located at position 141854 relative to the genome of Human herpesvirus 1.

[19250] VGAM1378 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1378 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19251] An enzyme complex designated DICER COMPLEX, dices the VGAM1378 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1378 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1378 RNA is designated SEQ ID:4089, and is provided hereinbelow with reference to the sequence listing part.

[19252] VGAM1378 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1378 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1378 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19253] VGAM1378 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1378 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1378 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1378 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1378 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19254] The complementary binding of VGAM1378 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1378 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1378

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1378 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19255] It is appreciated that VGAM1378 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1378 host target genes. The mRNA of each one of this plurality of VGAM1378 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1378 RNA, herein designated VGAM RNA, and which when bound by VGAM1378 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1378 host target proteins.

[19256] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1378 gene, herein designated VGAM GENE, on one or more VGAM1378 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19257] It is yet further appreciated that a function of VGAM1378 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1378 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1378 correlate with, and may be deduced from, the identity of the host target genes which VGAM1378 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19258] Nucleotide sequences of the VGAM1378 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1378 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1378 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1378 are further described hereinbelow with reference to Table 1.

[19259] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1378 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19260] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1379 (VGAM1379) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19261] VGAM1379 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1379 was detected is described hereinabove with reference to Figs. 2-8.

[19262] VGAM1379 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 1. VGAM1379 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[19263] VGAM1379 gene, herein designated VGAM GENE, encodes a VGAM1379 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1379 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1379 precursor RNA is designated SEQ ID:1365, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1365 is located at position 142746 relative to the genome of Human herpesvirus 1.

[19264] VGAM1379 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1379 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19265] An enzyme complex designated DICER COMPLEX, dices

the VGAM1379 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1379 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1379 RNA is designated SEQ ID:4090, and is provided hereinbelow with reference to the sequence listing part.

[19266] VGAM1379 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1379 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1379 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19267] VGAM1379 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1379 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1379 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1379 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1379 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19268] The complementary binding of VGAM1379 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1379 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1379 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1379 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19269] It is appreciated that VGAM1379 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1379 host target genes. The mRNA of each one of this plurality of VGAM1379 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1379 RNA, herein designated VGAM RNA, and which when bound by VGAM1379 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1379 host target proteins.

[19270] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1379 gene, herein designated VGAM GENE, on one or more VGAM1379 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19271] It is yet further appreciated that a function of VGAM1379 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1379 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1379 correlate with, and may be deduced from, the identity of the host target genes which VGAM1379 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19272] Nucleotide sequences of the VGAM1379 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1379 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1379 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1379 are further described hereinbelow with reference to Table 1.

[19273] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1379 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19274] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1380 (VGAM1380) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19275] VGAM1380 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1380 was detected is described hereinabove with reference to Figs. 2-8.

[19276] VGAM1380 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Himetobi P virus. VGAM1380 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[19277] VGAM1380 gene, herein designated VGAM GENE, encodes a VGAM1380 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1380 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1380 precursor RNA is designated SEQ ID:1366, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1366 is located at position 2325 relative to the genome of Himetobi P virus.

[19278] VGAM1380 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1380 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19279] An enzyme complex designated DICER COMPLEX, dices the VGAM1380 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1380 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1380 RNA is designated SEQ ID:4091, and is provided hereinbelow with reference to the sequence listing part.

[19280] VGAM1380 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1380 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1380 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19281] VGAM1380 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1380 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1380 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1380 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1380 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19282] The complementary binding of VGAM1380 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1380 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1380 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1380 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19283] It is appreciated that VGAM1380 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1380 host target genes. The mRNA of each one of this plurality of VGAM1380 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1380 RNA, herein designated VGAM RNA, and which when bound by VGAM1380 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1380 host target proteins.

[19284] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1380 gene, herein designated VGAM GENE, on one or more VGAM1380 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19285] It is yet further appreciated that a function of VGAM1380 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1380 include diagnosis, prevention and treatment of viral infection by Himetobi P virus. Specific functions, and accordingly utilities, of VGAM1380 correlate with, and may be deduced from, the identity of the host target genes which VGAM1380 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19286] Nucleotide sequences of the VGAM1380 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1380 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1380 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1380 are further described hereinbelow with reference to Table 1.

[19287] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1380 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19288] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1381 (VGAM1381) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19289] VGAM1381 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1381 was detected is described hereinabove with reference to Figs. 2-8.

[19290] VGAM1381 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Himetobi P virus.

VGAM1381 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19291] VGAM1381 gene, herein designated VGAM GENE, encodes a VGAM1381 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1381 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1381 precursor RNA is designated SEQ ID:1367, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1367 is located at position 8357 relative to the genome of Himetobi P virus.

[19292] VGAM1381 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1381 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[19293] An enzyme complex designated DICER COMPLEX, dices the VGAM1381 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1381 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1381 RNA is designated SEQ ID:4092, and is provided hereinbelow with reference to the sequence listing part.

[19294] VGAM1381 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1381 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1381 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19295] VGAM1381 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1381 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1381 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1381 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1381 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19296] The complementary binding of VGAM1381 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1381 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1381 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1381 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19297] It is appreciated that VGAM1381 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1381 host target genes. The mRNA of each one of this plurality of VGAM1381 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1381 RNA, herein designated VGAM RNA, and which when bound by VGAM1381 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1381 host target proteins.

[19298] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1381 gene, herein designated VGAM GENE, on one or more VGAM1381 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19299] It is yet further appreciated that a function of VGAM1381 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1381 include diagnosis, prevention and treatment of viral infection by Himetobi P virus. Specific functions, and accordingly utilities, of VGAM1381 correlate with, and may be deduced from, the identity of the host target genes which VGAM1381 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19300] Nucleotide sequences of the VGAM1381 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1381 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1381 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1381 are further described hereinbelow with reference to Table 1.

[19301] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1381 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19302] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1382 (VGAM1382) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19303] VGAM1382 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1382 was detected is described hereinabove with reference to Figs. 2-8.

[19304] VGAM1382 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Himetobi P virus.

VGAM1382 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19305] VGAM1382 gene, herein designated VGAM GENE, encodes a VGAM1382 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1382 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1382 precursor RNA is designated SEQ ID:1368, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1368 is located at position 4080 relative to the genome of Himetobi P virus.

[19306] VGAM1382 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1382 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19307] An enzyme complex designated DICER COMPLEX, dices the VGAM1382 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1382 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1382 RNA is designated SEQ ID:4093, and is provided hereinbelow with reference to the sequence listing part.

[19308] VGAM1382 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1382 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1382 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19309] VGAM1382 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1382 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1382 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1382 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19310] The complementary binding of VGAM1382 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1382 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1382 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1382 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19311] It is appreciated that VGAM1382 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1382 host target genes. The mRNA of each one of this plurality of VGAM1382 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1382 RNA, herein designated VGAM RNA, and which when bound by VGAM1382 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1382 host target proteins.

[19312] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1382 gene, herein designated VGAM GENE, on one or more VGAM1382 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19313] It is yet further appreciated that a function of VGAM1382 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of viral infection by Himetobi P virus. Specific functions, and accordingly utilities, of VGAM1382 correlate with, and may be deduced from, the identity of the host target genes which VGAM1382 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19314] Nucleotide sequences of the VGAM1382 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1382 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1382 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1382 are further described hereinbelow with reference to Table 1.

[19315] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1382 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19316] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1383 (VGAM1383) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19317] VGAM1383 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1383 was detected is described hereinabove with reference to Figs. 2-8.

[19318] VGAM1383 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Himetobi P virus.

VGAM1383 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19319] VGAM1383 gene, herein designated VGAM GENE, encodes a VGAM1383 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1383 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1383 precursor RNA is designated SEQ ID:1369, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1369 is located at position 7039 relative to the genome of Himetobi P virus.

[19320] VGAM1383 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1383 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19321] An enzyme complex designated DICER COMPLEX, dices the VGAM1383 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1383 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1383 RNA is designated SEQ ID:4094, and is provided hereinbelow with reference to the sequence listing part.

[19322] VGAM1383 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1383 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1383 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[19323] VGAM1383 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1383 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1383 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1383 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1383 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19324] The complementary binding of VGAM1383 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1383 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1383 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1383 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19325] It is appreciated that VGAM1383 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1383 host target genes. The mRNA of each one of this plurality of VGAM1383 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1383 RNA, herein designated VGAM RNA, and which when bound by VGAM1383 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1383 host target proteins.

[19326] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1383 gene, herein designated VGAM GENE, on one

or more VGAM1383 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19327] It is yet further appreciated that a function of VGAM1383 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1383 include diagnosis, prevention and treatment of viral infection by Himetobi P virus. Specific functions, and accordingly utilities, of VGAM1383 correlate with, and may be deduced from, the identity of the host target genes which VGAM1383 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19328] Nucleotide sequences of the VGAM1383 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1383 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1383 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1383 are further described hereinbelow with reference to Table 1.

[19329] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1383 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19330] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1384 (VGAM1384) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19331] VGAM1384 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1384 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[19332] VGAM1384 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Himetobi P virus.

VGAM1384 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19333] VGAM1384 gene, herein designated VGAM GENE, encodes a VGAM1384 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1384 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1384 precursor RNA is designated SEQ ID:1370, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1370 is located at position 1905 relative to the genome of Himetobi P virus.

[19334] VGAM1384 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1384 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19335] An enzyme complex designated DICER COMPLEX, dices the VGAM1384 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1384 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1384 RNA is designated SEQ ID:4095, and is provided hereinbelow with reference to the sequence listing part.

[19336] VGAM1384 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1384 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1384 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19337] VGAM1384 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1384 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1384 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1384 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[19338] The complementary binding of VGAM1384 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1384 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1384 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1384 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19339] It is appreciated that VGAM1384 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1384 host target genes. The mRNA of each one of this plurality of VGAM1384 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1384 RNA, herein designated VGAM RNA, and which when bound by VGAM1384 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1384 host target proteins.

[19340] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1384 gene, herein designated VGAM GENE, on one or more VGAM1384 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19341] It is yet further appreciated that a function of VGAM1384 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of viral infection by Himetobi P virus. Specific functions, and accordingly utilities, of VGAM1384 correlate with, and may be deduced from, the identity of the host target genes which VGAM1384 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[19342] Nucleotide sequences of the VGAM1384 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1384 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1384 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1384 are further described hereinbelow with reference to Table 1.

[19343] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1384 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19344] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1385 (VGAM1385) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19345] VGAM1385 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1385 was detected is described hereinabove with reference to Figs. 2–8.

[19346] VGAM1385 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Himetobi P virus.

VGAM1385 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19347] VGAM1385 gene, herein designated VGAM GENE, encodes a VGAM1385 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1385 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1385 precursor RNA is designated SEQ ID:1371, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1371 is located at position 2435 relative to the genome of Himetobi P virus.

[19348] VGAM1385 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1385 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19349] An enzyme complex designated DICER COMPLEX, dices the VGAM1385 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1385 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1385 RNA is designated SEQ ID:4096, and is provided hereinbelow with reference to the sequence listing part.

[19350] VGAM1385 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1385 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1385 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19351] VGAM1385 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1385 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1385 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1385 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1385 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19352] The complementary binding of VGAM1385 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1385 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1385 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1385 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19353] It is appreciated that VGAM1385 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1385 host target genes. The mRNA of each one of this plurality of VGAM1385 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1385 RNA, herein designated VGAM RNA, and which when bound by VGAM1385 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1385 host target proteins.

[19354] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1385 gene, herein designated VGAM GENE, on one or more VGAM1385 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19355] It is yet further appreciated that a function of VGAM1385 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1385 include diagnosis, prevention and treatment of viral infection by Himetobi P virus. Specific functions, and accordingly utilities, of VGAM1385 correlate with, and may be deduced from, the identity of the host target genes which VGAM1385 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[19356] Nucleotide sequences of the VGAM1385 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1385 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1385 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1385 are further described hereinbelow with reference to Table 1.

[19357] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1385 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19358] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1386 (VGAM1386) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19359] VGAM1386 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1386 was detected is described hereinabove with reference to Figs. 2–8.

[19360] VGAM1386 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Himetobi P virus.

VGAM1386 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19361] VGAM1386 gene, herein designated VGAM GENE, encodes a VGAM1386 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1386 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1386 precursor RNA is designated SEQ ID:1372, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1372 is located at position 8878 relative to the genome of Himetobi P virus.

[19362] VGAM1386 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1386 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19363] An enzyme complex designated DICER COMPLEX, dices the VGAM1386 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1386 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM1386 RNA is designated SEQ ID:4097, and is provided hereinbelow with reference to the sequence listing part.

[19364] VGAM1386 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1386 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1386 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19365] VGAM1386 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1386 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1386 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1386 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1386 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19366] The complementary binding of VGAM1386 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1386 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1386 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1386 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19367] It is appreciated that VGAM1386 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1386 host target genes. The mRNA of each one of this plurality of VGAM1386 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1386 RNA, herein designated VGAM RNA, and which when bound by VGAM1386 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1386 host target proteins.

[19368] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1386 gene, herein designated VGAM GENE, on one or more VGAM1386 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19369] It is yet further appreciated that a function of VGAM1386 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1386 include diagnosis, prevention and treatment of viral infection by Himetobi P virus. Specific functions, and accordingly utilities, of VGAM1386 correlate with, and may be deduced from, the identity of the

host target genes which VGAM1386 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19370] Nucleotide sequences of the VGAM1386 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1386 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1386 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1386 are further described hereinbelow with reference to Table 1.

[19371] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1386 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19372] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1387 (VGAM1387) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19373] VGAM1387 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1387 was detected is described hereinabove with reference to Figs. 2–8.

[19374] VGAM1387 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Himetobi P virus. VGAM1387 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19375] VGAM1387 gene, herein designated VGAM GENE, encodes a VGAM1387 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1387 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1387 precursor RNA is designated SEQ ID:1373, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1373 is located at position 7593 relative to the genome of Himetobi P virus.

[19376] VGAM1387 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1387 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19377] An enzyme complex designated DICER COMPLEX, dices the VGAM1387 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1387 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1387 RNA is designated SEQ ID:4098, and is provided hereinbelow with reference to the sequence listing part.

[19378] VGAM1387 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1387 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1387 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19379] VGAM1387 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1387 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1387 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1387 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1387 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19380] The complementary binding of VGAM1387 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1387 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1387 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1387 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19381] It is appreciated that VGAM1387 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1387 host target genes. The mRNA of each one of this plurality of VGAM1387 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1387 RNA, herein designated VGAM RNA, and which when bound by VGAM1387 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1387 host target proteins.

[19382] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1387 gene, herein designated VGAM GENE, on one

or more VGAM1387 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19383] It is yet further appreciated that a function of VGAM1387 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1387 include diagnosis, prevention and treatment of viral infection by Himetobi P virus. Specific functions, and accordingly utilities, of VGAM1387 correlate with, and may be deduced from, the identity of the host target genes which VGAM1387 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19384] Nucleotide sequences of the VGAM1387 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1387 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1387 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1387 are further described hereinbelow with reference to Table 1.

[19385] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1387 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19386] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1388 (VGAM1388) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19387] VGAM1388 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1388 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[19388] VGAM1388 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM1388 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19389] VGAM1388 gene, herein designated VGAM GENE, encodes a VGAM1388 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1388 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1388 precursor RNA is designated SEQ ID:1374, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1374 is located at position 58541 relative to the genome of Cercopithecine herpesvirus 7.

[19390] VGAM1388 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1388 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19391] An enzyme complex designated DICER COMPLEX, dices the VGAM1388 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1388 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM1388 RNA is designated SEQ ID:4099, and is provided hereinbelow with reference to the sequence listing part.

[19392] VGAM1388 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1388 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1388 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19393] VGAM1388 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1388 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1388 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1388 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1388 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19394] The complementary binding of VGAM1388 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1388 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1388 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1388 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19395] It is appreciated that VGAM1388 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1388 host target genes. The mRNA of each one of this plurality of VGAM1388 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1388 RNA, herein designated VGAM RNA, and which when bound by VGAM1388 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1388 host target proteins.

[19396] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1388 gene, herein designated VGAM GENE, on one or more VGAM1388 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19397] It is yet further appreciated that a function of VGAM1388 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1388 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1388 correlate with, and may be deduced from, the identity of the host target genes which VGAM1388 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19398] Nucleotide sequences of the VGAM1388 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1388 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1388 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1388 are further described hereinbelow with reference to Table 1.

[19399] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1388 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19400] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1389 (VGAM1389) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19401] VGAM1389 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1389 was detected is described hereinabove with reference to Figs. 2-8.

[19402] VGAM1389 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM1389 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19403] VGAM1389 gene, herein designated VGAM GENE, encodes a VGAM1389 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1389 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1389 precursor RNA is designated SEQ ID:1375, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1375 is located at position 56184 relative to the genome of Cercopithecine herpesvirus 7.

[19404] VGAM1389 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1389 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19405] An enzyme complex designated DICER COMPLEX, dices the VGAM1389 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1389 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1389 RNA is designated SEQ ID:4100, and is provided hereinbelow with reference to the sequence listing part.

[19406] VGAM1389 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1389 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1389 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19407] VGAM1389 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1389 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1389 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1389 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1389 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19408] The complementary binding of VGAM1389 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1389 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1389 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1389 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19409] It is appreciated that VGAM1389 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1389 host target genes. The mRNA of each one of this plurality of VGAM1389 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1389 RNA, herein designated VGAM RNA, and which when bound by VGAM1389 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1389 host target proteins.

[19410] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1389 gene, herein designated VGAM GENE, on one or more VGAM1389 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19411] It is yet further appreciated that a function of VGAM1389 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1389 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of

VGAM1389 correlate with, and may be deduced from, the identity of the host target genes which VGAM1389 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19412] Nucleotide sequences of the VGAM1389 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1389 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1389 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1389 are further described hereinbelow with reference to Table 1.

[19413] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1389 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19414] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1390 (VGAM1390) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[19415] VGAM1390 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1390 was detected is described hereinabove with reference to Figs. 2–8.

[19416] VGAM1390 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM1390 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19417] VGAM1390 gene, herein designated VGAM GENE, encodes a VGAM1390 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1390 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1390 precursor RNA is designated SEQ ID:1376, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1376 is located at position 57196 relative to the genome of Cercopithecine herpesvirus 7.

[19418] VGAM1390 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1390 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19419] An enzyme complex designated DICER COMPLEX, dices the VGAM1390 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1390 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1390 RNA is designated SEQ ID:4101, and is provided hereinbelow with reference to the sequence listing part.

[19420] VGAM1390 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1390 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1390 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19421] VGAM1390 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1390 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1390 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1390 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1390 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19422] The complementary binding of VGAM1390 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1390 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1390 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1390 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19423] It is appreciated that VGAM1390 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1390 host target genes. The mRNA of each one of this plurality of VGAM1390 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1390 RNA, herein designated VGAM RNA, and which when bound by VGAM1390 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1390 host target proteins.

[19424] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1390 gene, herein designated VGAM GENE, on one or more VGAM1390 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19425] It is yet further appreciated that a function of VGAM1390 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1390 include diagnosis, prevention and

treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1390 correlate with, and may be deduced from, the identity of the host target genes which VGAM1390 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19426] Nucleotide sequences of the VGAM1390 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1390 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1390 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1390 are further described hereinbelow with reference to Table 1.

[19427] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1390 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19428] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1391 (VGAM1391) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19429] VGAM1391 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1391 was detected is described hereinabove with reference to Figs. 2–8.

[19430] VGAM1391 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Wheat streak mosaic virus. VGAM1391 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19431] VGAM1391 gene, herein designated VGAM GENE, encodes a VGAM1391 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1391 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1391 precursor RNA is designated SEQ ID:1377, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1377 is located at position 6460 relative to the genome of Wheat streak mosaic virus.

[19432] VGAM1391 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1391 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19433] An enzyme complex designated DICER COMPLEX, dices the VGAM1391 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1391 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM1391 RNA is designated SEQ ID:4102, and is provided hereinbelow with reference to the sequence listing part.

[19434] VGAM1391 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1391 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1391 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19435] VGAM1391 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1391 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1391 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1391 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1391 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19436] The complementary binding of VGAM1391 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1391 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1391 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1391 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19437] It is appreciated that VGAM1391 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1391 host target genes. The mRNA of each one of this plurality of VGAM1391 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1391 RNA, herein designated VGAM

RNA, and which when bound by VGAM1391 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1391 host target proteins.

[19438] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1391 gene, herein designated VGAM GENE, on one or more VGAM1391 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19439] It is yet further appreciated that a function of VGAM1391 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1391 include diagnosis, prevention and treatment of viral infection by Wheat streak mosaic virus. Specific functions, and accordingly utilities, of VGAM1391 correlate with, and may be deduced from, the identity of the host target genes which VGAM1391 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19440] Nucleotide sequences of the VGAM1391 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1391 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1391 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1391 are further described hereinbelow with reference to Table 1.

[19441] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1391 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19442] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1392 (VGAM1392) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19443] VGAM1392 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1392 was detected is described hereinabove with reference to Figs. 2–8.

[19444] VGAM1392 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Wheat streak mosaic virus. VGAM1392 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19445] VGAM1392 gene, herein designated VGAM GENE, encodes a VGAM1392 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1392 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1392 precursor RNA is designated SEQ ID:1378, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1378 is located at position 9058

relative to the genome of Wheat streak mosaic virus.

[19446] VGAM1392 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1392 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19447] An enzyme complex designated DICER COMPLEX, dices the VGAM1392 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1392 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM1392 RNA is designated SEQ ID:4103, and is provided hereinbelow with reference to the sequence listing part.

[19448] VGAM1392 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1392 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1392 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19449] VGAM1392 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1392 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1392 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1392 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1392 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19450] The complementary binding of VGAM1392 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1392 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1392 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1392 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19451] It is appreciated that VGAM1392 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1392 host target genes. The mRNA of each one of this plurality of VGAM1392 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1392 RNA, herein designated VGAM RNA, and which when bound by VGAM1392 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1392 host target proteins.

[19452] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1392 gene, herein designated VGAM GENE, on one or more VGAM1392 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19453] It is yet further appreciated that a function of VGAM1392 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1392 include diagnosis, prevention and treatment of viral infection by Wheat streak mosaic virus. Specific functions, and accordingly utilities, of VGAM1392 correlate with, and may be deduced from, the identity of the host target genes which VGAM1392 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19454] Nucleotide sequences of the VGAM1392 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM1392 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1392 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1392 are further described hereinbelow with reference to Table 1.

[19455] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1392 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19456] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1393 (VGAM1393) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19457] VGAM1393 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1393 was detected is described hereinabove with reference to Figs. 2–8.

[19458] VGAM1393 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Wheat streak mosaic virus. VGAM1393 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19459] VGAM1393 gene, herein designated VGAM GENE, encodes a VGAM1393 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1393 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1393 precursor RNA is designated SEQ ID:1379, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:1379 is located at position 3923 relative to the genome of Wheat streak mosaic virus.

[19460] VGAM1393 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1393 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19461] An enzyme complex designated DICER COMPLEX, dices the VGAM1393 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1393 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1393 RNA is designated SEQ ID:4104, and is provided hereinbelow with reference to the sequence

listing part.

[19462] VGAM1393 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1393 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1393 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19463] VGAM1393 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1393 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1393 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1393 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1393 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19464] The complementary binding of VGAM1393 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1393 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1393 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1393 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19465] It is appreciated that VGAM1393 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1393 host target genes. The mRNA of each one of this plurality of VGAM1393 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1393 RNA, herein designated VGAM RNA, and which when bound by VGAM1393 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1393 host target proteins.

[19466] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1393 gene, herein designated VGAM GENE, on one or more VGAM1393 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19467] It is yet further appreciated that a function of VGAM1393

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1393 include diagnosis, prevention and treatment of viral infection by Wheat streak mosaic virus. Specific functions, and accordingly utilities, of VGAM1393 correlate with, and may be deduced from, the identity of the host target genes which VGAM1393 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19468] Nucleotide sequences of the VGAM1393 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1393 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1393 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1393 are further described hereinbelow with reference to Table 1.

[19469] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1393 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19470] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1394 (VGAM1394) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19471] VGAM1394 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1394 was detected is described hereinabove with reference to Figs. 2–8.

[19472] VGAM1394 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Wheat streak mosaic virus. VGAM1394 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19473] VGAM1394 gene, herein designated VGAM GENE, encodes a VGAM1394 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1394 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1394 precursor RNA is designated SEQ ID:1380, and is provided here–

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1380 is located at position 2215 relative to the genome of Wheat streak mosaic virus.

[19474] VGAM1394 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1394 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19475] An enzyme complex designated DICER COMPLEX, dices the VGAM1394 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1394 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1394 RNA is designated SEQ ID:4105, and

is provided hereinbelow with reference to the sequence listing part.

[19476] VGAM1394 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1394 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1394 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19477] VGAM1394 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1394 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1394 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1394 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1394 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19478] The complementary binding of VGAM1394 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1394 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1394 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1394 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19479] It is appreciated that VGAM1394 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1394 host target genes. The mRNA of each one of this plurality of VGAM1394 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1394 RNA, herein designated VGAM RNA, and which when bound by VGAM1394 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1394 host target proteins.

[19480] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1394 gene, herein designated VGAM GENE, on one or more VGAM1394 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19481] It is yet further appreciated that a function of VGAM1394 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1394 include diagnosis, prevention and treatment of viral infection by Wheat streak mosaic virus. Specific functions, and accordingly utilities, of VGAM1394 correlate with, and may be deduced from, the identity of the host target genes which VGAM1394 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19482] Nucleotide sequences of the VGAM1394 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1394 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1394 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1394 are further described hereinbelow with reference to Table 1.

[19483] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1394 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19484] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1395 (VGAM1395) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19485] VGAM1395 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1395 was detected is described hereinabove with reference to Figs. 2–8.

[19486] VGAM1395 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpea aphid-borne mosaic virus. VGAM1395 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19487] VGAM1395 gene, herein designated VGAM GENE, encodes a VGAM1395 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1395 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1395 precu-

sor RNA is designated SEQ ID:1381, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1381 is located at position 3170 relative to the genome of Cowpea aphid-borne mosaic virus.

[19488] VGAM1395 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1395 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19489] An enzyme complex designated DICER COMPLEX, dices the VGAM1395 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1395 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1395 RNA is designated SEQ ID:4106, and is provided hereinbelow with reference to the sequence listing part.

[19490] VGAM1395 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1395 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1395 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19491] VGAM1395 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1395 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1395 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1395 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1395 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19492] The complementary binding of VGAM1395 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1395 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1395 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1395 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19493] It is appreciated that VGAM1395 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1395 host target genes. The mRNA of each one of this plurality of VGAM1395 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1395 RNA, herein designated VGAM RNA, and which when bound by VGAM1395 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1395 host target proteins.

[19494] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1395 gene, herein designated VGAM GENE, on one or more VGAM1395 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [19495] It is yet further appreciated that a function of VGAM1395 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1395 include diagnosis, prevention and treatment of viral infection by Cowpea aphid-borne mosaic virus. Specific functions, and accordingly utilities, of VGAM1395 correlate with, and may be deduced from, the identity of the host target genes which VGAM1395 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [19496] Nucleotide sequences of the VGAM1395 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1395 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1395 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1395 are further described hereinbelow with reference to Table 1.
- [19497] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1395 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19498] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1396 (VGAM1396) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19499] VGAM1396 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1396 was detected is described hereinabove with reference to Figs. 2-8.

[19500] VGAM1396 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpea aphid-borne mosaic virus. VGAM1396 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19501] VGAM1396 gene, herein designated VGAM GENE, encodes a VGAM1396 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1396 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1396 precursor RNA is designated SEQ ID:1382, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1382 is located at position 3478 relative to the genome of Cowpea aphid-borne mosaic virus.

[19502] VGAM1396 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1396 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19503] An enzyme complex designated DICER COMPLEX, dices the VGAM1396 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1396 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1396 RNA is designated SEQ ID:4107, and is provided hereinbelow with reference to the sequence listing part.

[19504] VGAM1396 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1396 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1396 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19505] VGAM1396 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1396 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1396 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1396 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1396 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19506] The complementary binding of VGAM1396 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1396 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1396 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1396 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19507] It is appreciated that VGAM1396 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1396 host target genes. The mRNA of each one of this plurality of VGAM1396 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1396 RNA, herein designated VGAM RNA, and which when bound by VGAM1396 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1396 host target proteins.

[19508] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1396 gene, herein designated VGAM GENE, on one or more VGAM1396 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19509] It is yet further appreciated that a function of VGAM1396 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1396 include diagnosis, prevention and treatment of viral infection by Cowpea aphid-borne mosaic virus. Specific functions, and accordingly utilities, of VGAM1396 correlate with, and may be deduced from, the identity of the host target genes which VGAM1396 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19510] Nucleotide sequences of the VGAM1396 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1396 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1396 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1396 are further described hereinbelow with reference to Table 1.

[19511] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1396 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19512] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1397 (VGAM1397) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19513] VGAM1397 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1397 was detected is described hereinabove with reference to Figs. 2-8.

[19514] VGAM1397 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpea aphid-borne mosaic virus. VGAM1397 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19515] VGAM1397 gene, herein designated VGAM GENE, encodes a VGAM1397 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1397 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1397 precursor RNA is designated SEQ ID:1383, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1383 is located at position 2518 relative to the genome of Cowpea aphid-borne mosaic virus.

[19516] VGAM1397 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1397 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19517] An enzyme complex designated DICER COMPLEX, dices the VGAM1397 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1397 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM1397 RNA is designated SEQ ID:4108, and is provided hereinbelow with reference to the sequence listing part.

[19518] VGAM1397 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1397 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1397 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19519] VGAM1397 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1397 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1397 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1397 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1397 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19520] The complementary binding of VGAM1397 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1397 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1397 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1397 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19521] It is appreciated that VGAM1397 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1397 host target genes. The mRNA of each one of this plurality of VGAM1397 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1397 RNA, herein designated VGAM RNA, and which when bound by VGAM1397 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1397 host target proteins.

[19522] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1397 gene, herein designated VGAM GENE, on one or more VGAM1397 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19523] It is yet further appreciated that a function of VGAM1397 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1397 include diagnosis, prevention and treatment of viral infection by Cowpea aphid-borne mosaic virus. Specific functions, and accordingly utilities, of VGAM1397 correlate with, and may be deduced from, the identity of the host target genes which VGAM1397 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19524] Nucleotide sequences of the VGAM1397 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1397 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1397 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1397 are further described hereinbelow with reference to Table 1.

[19525] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1397 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19526] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1398 (VGAM1398) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19527] VGAM1398 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1398 was detected is described hereinabove with reference to Figs. 2-8.

[19528] VGAM1398 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Perina nuda picorna-like virus. VGAM1398 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19529] VGAM1398 gene, herein designated VGAM GENE, encodes

a VGAM1398 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1398 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1398 precursor RNA is designated SEQ ID:1384, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1384 is located at position 9232 relative to the genome of Perina nuda picorna-like virus.

[19530] VGAM1398 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1398 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19531] An enzyme complex designated DICER COMPLEX, dices the VGAM1398 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1398 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1398 RNA is designated SEQ ID:4109, and is provided hereinbelow with reference to the sequence listing part.

[19532] VGAM1398 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1398 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1398 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19533] VGAM1398 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1398 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1398 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1398 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1398 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19534] The complementary binding of VGAM1398 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1398 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1398 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1398 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19535] It is appreciated that VGAM1398 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1398 host target genes. The mRNA of each one of this plurality of VGAM1398 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1398 RNA, herein designated VGAM RNA, and which when bound by VGAM1398 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1398 host target proteins.

[19536] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1398 gene, herein designated VGAM GENE, on one or more VGAM1398 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19537] It is yet further appreciated that a function of VGAM1398 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1398 include diagnosis, prevention and treatment of viral infection by Perina nuda picorna-like virus. Specific functions, and accordingly utilities, of VGAM1398 correlate with, and may be deduced from, the identity of the host target genes which VGAM1398 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19538] Nucleotide sequences of the VGAM1398 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM1398 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1398 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1398 are further

described hereinbelow with reference to Table 1.

[19539] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1398 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19540] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1399 (VGAM1399) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19541] VGAM1399 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1399 was detected is described hereinabove with reference to Figs. 2-8.

[19542] VGAM1399 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Perina nuda picorna-like virus. VGAM1399 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19543] VGAM1399 gene, herein designated VGAM GENE, encodes a VGAM1399 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1399 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1399 precursor RNA is designated SEQ ID:1385, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1385 is located at position 2981 relative to the genome of Perina nuda picorna-like virus.

[19544] VGAM1399 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1399 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19545] An enzyme complex designated DICER COMPLEX, dices the VGAM1399 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1399 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1399 RNA is designated SEQ ID:4110, and is provided hereinbelow with reference to the sequence listing part.

[19546] VGAM1399 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1399 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1399 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19547] VGAM1399 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1399 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1399 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1399 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1399 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19548] The complementary binding of VGAM1399 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1399 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1399

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1399 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19549] It is appreciated that VGAM1399 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1399 host target genes. The mRNA of each one of this plurality of VGAM1399 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1399 RNA, herein designated VGAM RNA, and which when bound by VGAM1399 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1399 host target proteins.

[19550] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1399 gene, herein designated VGAM GENE, on one or more VGAM1399 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19551] It is yet further appreciated that a function of VGAM1399 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1399 include diagnosis, prevention and treatment of viral infection by Perina nuda picorna-like virus. Specific functions, and accordingly utilities, of VGAM1399 correlate with, and may be deduced from, the identity of the host target genes which VGAM1399 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19552] Nucleotide sequences of the VGAM1399 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1399 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1399 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1399 are further described hereinbelow with reference to Table 1.

[19553] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1399 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19554] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1400 (VGAM1400) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19555] VGAM1400 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1400 was detected is described hereinabove with reference to Figs. 2-8.

[19556] VGAM1400 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Perina nuda picorna-like virus. VGAM1400 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[19557] VGAM1400 gene, herein designated VGAM GENE, encodes a VGAM1400 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1400 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1400 precursor RNA is designated SEQ ID:1386, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1386 is located at position 2576 relative to the genome of Perina nuda picorna-like virus.

[19558] VGAM1400 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1400 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19559] An enzyme complex designated DICER COMPLEX, dices

the VGAM1400 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1400 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1400 RNA is designated SEQ ID:4111, and is provided hereinbelow with reference to the sequence listing part.

[19560] VGAM1400 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1400 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1400 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19561] VGAM1400 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1400 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1400 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1400 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1400 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19562] The complementary binding of VGAM1400 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1400 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1400 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1400 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19563] It is appreciated that VGAM1400 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1400 host target genes. The mRNA of each one of this plurality of VGAM1400 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1400 RNA, herein designated VGAM RNA, and which when bound by VGAM1400 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1400 host target proteins.

[19564] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1400 gene, herein designated VGAM GENE, on one or more VGAM1400 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19565] It is yet further appreciated that a function of VGAM1400 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1400 include diagnosis, prevention and treatment of viral infection by Perina nuda picorna-like virus. Specific functions, and accordingly utilities, of VGAM1400 correlate with, and may be deduced from, the identity of the host target genes which VGAM1400 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19566] Nucleotide sequences of the VGAM1400 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1400 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1400 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1400 are further described hereinbelow with reference to Table 1.

[19567] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1400 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19568] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1401 (VGAM1401) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19569] VGAM1401 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1401 was detected is described hereinabove with reference to Figs. 2-8.

[19570] VGAM1401 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Perina nuda picorna-like virus. VGAM1401 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19571] VGAM1401 gene, herein designated VGAM GENE, encodes a VGAM1401 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1401 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1401 precursor RNA is designated SEQ ID:1387, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1387 is located at position 7823 relative to the genome of Perina nuda picorna-like virus.

[19572] VGAM1401 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1401 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19573] An enzyme complex designated DICER COMPLEX, dices the VGAM1401 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1401 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1401 RNA is designated SEQ ID:4112, and is provided hereinbelow with reference to the sequence listing part.

[19574] VGAM1401 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1401 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1401 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19575] VGAM1401 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1401 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1401 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1401 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1401 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19576] The complementary binding of VGAM1401 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1401 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1401 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1401 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19577] It is appreciated that VGAM1401 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1401 host target genes. The mRNA of each one of this plurality of VGAM1401 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1401 RNA, herein designated VGAM RNA, and which when bound by VGAM1401 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1401 host target proteins.

[19578] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1401 gene, herein designated VGAM GENE, on one or more VGAM1401 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19579] It is yet further appreciated that a function of VGAM1401 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1401 include diagnosis, prevention and treatment of viral infection by Perina nuda picorna-like virus. Specific functions, and accordingly utilities, of VGAM1401 correlate with, and may be deduced from, the identity of the host target genes which VGAM1401 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19580] Nucleotide sequences of the VGAM1401 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1401 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1401 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1401 are further described hereinbelow with reference to Table 1.

[19581] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1401 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19582] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1402 (VGAM1402) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19583] VGAM1402 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1402 was detected is described hereinabove with reference to Figs. 2-8.

[19584] VGAM1402 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Perina nuda picorna-like

virus. VGAM1402 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19585] VGAM1402 gene, herein designated VGAM GENE, encodes a VGAM1402 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1402 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1402 precursor RNA is designated SEQ ID:1388, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1388 is located at position 7345 relative to the genome of Perina nuda picorna-like virus.

[19586] VGAM1402 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1402 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[19587] An enzyme complex designated DICER COMPLEX, dices the VGAM1402 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1402 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1402 RNA is designated SEQ ID:4113, and is provided hereinbelow with reference to the sequence listing part.

[19588] VGAM1402 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1402 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1402 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19589] VGAM1402 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1402 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1402 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1402 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1402 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19590] The complementary binding of VGAM1402 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1402 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1402 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1402 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19591] It is appreciated that VGAM1402 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1402 host target genes. The mRNA of each one of this plurality of VGAM1402 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1402 RNA, herein designated VGAM RNA, and which when bound by VGAM1402 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1402 host target proteins.

[19592] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1402 gene, herein designated VGAM GENE, on one or more VGAM1402 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19593] It is yet further appreciated that a function of VGAM1402 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1402 include diagnosis, prevention and treatment of viral infection by Perina nuda picorna-like virus. Specific functions, and accordingly utilities, of VGAM1402 correlate with, and may be deduced from, the identity of the host target genes which VGAM1402 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19594] Nucleotide sequences of the VGAM1402 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1402 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1402 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1402 are further described hereinbelow with reference to Table 1.

[19595] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1402 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19596] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1403 (VGAM1403) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19597] VGAM1403 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1403 was detected is described hereinabove with reference to Figs. 2-8.

[19598] VGAM1403 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Perina nuda picorna-like virus. VGAM1403 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19599] VGAM1403 gene, herein designated VGAM GENE, encodes a VGAM1403 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1403 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1403 precursor RNA is designated SEQ ID:1389, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1389 is located at position 7194 relative to the genome of Perina nuda picorna-like virus.

[19600] VGAM1403 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1403 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19601] An enzyme complex designated DICER COMPLEX, dices the VGAM1403 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1403 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1403 RNA is designated SEQ ID:4114, and is provided hereinbelow with reference to the sequence listing part.

[19602] VGAM1403 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1403 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1403 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19603] VGAM1403 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1403 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1403 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1403 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1403 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19604] The complementary binding of VGAM1403 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1403 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1403 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1403 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19605] It is appreciated that VGAM1403 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1403 host target genes. The mRNA of each one of this plurality of VGAM1403 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1403 RNA, herein designated VGAM RNA, and which when bound by VGAM1403 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1403 host target proteins.

[19606] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1403 gene, herein designated VGAM GENE, on one or more VGAM1403 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19607] It is yet further appreciated that a function of VGAM1403 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1403 include diagnosis, prevention and treatment of viral infection by Perina nuda picorna-like virus. Specific functions, and accordingly utilities, of VGAM1403 correlate with, and may be deduced from, the identity of the host target genes which VGAM1403 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19608] Nucleotide sequences of the VGAM1403 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1403 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1403 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1403 are further described hereinbelow with reference to Table 1.

[19609] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1403 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19610] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1404 (VGAM1404) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19611] VGAM1404 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1404 was detected is described hereinabove with reference to Figs. 2-8.

[19612] VGAM1404 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Perina nuda picorna-like virus. VGAM1404 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19613] VGAM1404 gene, herein designated VGAM GENE, encodes a VGAM1404 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1404 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1404 precursor RNA is designated SEQ ID:1390, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1390 is located at position 8964 relative to the genome of Perina nuda picorna-like virus.

[19614] VGAM1404 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1404 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19615] An enzyme complex designated DICER COMPLEX, dices the VGAM1404 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1404 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 62%) nucleotide sequence of VGAM1404 RNA is designated SEQ ID:4115, and is provided hereinbelow with reference to the sequence listing part.

[19616] VGAM1404 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1404 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1404 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[19617] VGAM1404 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1404 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1404 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1404 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1404 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19618] The complementary binding of VGAM1404 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1404 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1404 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1404 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19619] It is appreciated that VGAM1404 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1404 host target genes. The mRNA of each one of this plurality of VGAM1404 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1404 RNA, herein designated VGAM RNA, and which when bound by VGAM1404 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1404 host target proteins.

[19620] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1404 gene, herein designated VGAM GENE, on one

or more VGAM1404 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19621] It is yet further appreciated that a function of VGAM1404 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1404 include diagnosis, prevention and treatment of viral infection by Perina nuda picorna-like virus. Specific functions, and accordingly utilities, of VGAM1404 correlate with, and may be deduced from, the identity of the host target genes which VGAM1404 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19622] Nucleotide sequences of the VGAM1404 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1404 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1404 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1404 are further described hereinbelow with reference to Table 1.

[19623] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1404 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19624] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1405 (VGAM1405) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19625] VGAM1405 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1405 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[19626] VGAM1405 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Perina nuda picorna-like virus. VGAM1405 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19627] VGAM1405 gene, herein designated VGAM GENE, encodes a VGAM1405 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1405 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1405 precursor RNA is designated SEQ ID:1391, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1391 is located at position 3355 relative to the genome of Perina nuda picorna-like virus.

[19628] VGAM1405 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1405 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19629] An enzyme complex designated DICER COMPLEX, dices the VGAM1405 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1405 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM1405 RNA is designated SEQ ID:4116, and is provided hereinbelow with reference to the sequence listing part.

[19630] VGAM1405 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1405 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1405 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19631] VGAM1405 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1405 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1405 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1405 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1405 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[19632] The complementary binding of VGAM1405 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1405 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1405 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1405 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19633] It is appreciated that VGAM1405 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1405 host target genes. The mRNA of each one of this plurality of VGAM1405 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1405 RNA, herein designated VGAM RNA, and which when bound by VGAM1405 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1405 host target proteins.

[19634] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1405 gene, herein designated VGAM GENE, on one or more VGAM1405 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19635] It is yet further appreciated that a function of VGAM1405 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1405 include diagnosis, prevention and treatment of viral infection by Perina nuda picorna-like virus. Specific functions, and accordingly utilities, of VGAM1405 correlate with, and may be deduced from, the identity of the host target genes which VGAM1405 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[19636] Nucleotide sequences of the VGAM1405 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1405 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1405 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1405 are further described hereinbelow with reference to Table 1.

[19637] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1405 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19638] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1406 (VGAM1406) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19639] VGAM1406 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1406 was detected is described hereinabove with reference to Figs. 2–8.

[19640] VGAM1406 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Perina nuda picorna-like virus. VGAM1406 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19641] VGAM1406 gene, herein designated VGAM GENE, encodes a VGAM1406 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1406 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1406 precursor RNA is designated SEQ ID:1392, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1392 is located at position 6999 relative to the genome of Perina nuda picorna-like virus.

[19642] VGAM1406 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1406 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19643] An enzyme complex designated DICER COMPLEX, dices the VGAM1406 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1406 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1406 RNA is designated SEQ ID:4117, and is provided hereinbelow with reference to the sequence listing part.

[19644] VGAM1406 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1406 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1406 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19645] VGAM1406 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1406 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1406 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1406 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1406 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19646] The complementary binding of VGAM1406 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1406 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1406 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1406 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19647] It is appreciated that VGAM1406 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1406 host target genes. The mRNA of each one of this plurality of VGAM1406 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1406 RNA, herein designated VGAM RNA, and which when bound by VGAM1406 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1406 host target proteins.

[19648] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1406 gene, herein designated VGAM GENE, on one or more VGAM1406 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19649] It is yet further appreciated that a function of VGAM1406 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1406 include diagnosis, prevention and treatment of viral infection by Perina nuda picorna-like virus. Specific functions, and accordingly utilities, of VGAM1406 correlate with, and may be deduced from, the identity of the host target genes which VGAM1406 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19650] Nucleotide sequences of the VGAM1406 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1406 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1406 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1406 are further described hereinbelow with reference to Table 1.

[19651] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1406 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19652] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1407 (VGAM1407) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19653] VGAM1407 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1407 was detected is described hereinabove with reference to Figs. 2–8.

[19654] VGAM1407 gene, herein designated VGAM GENE, is a viral gene contained in the genome of acute bee paralysis virus. VGAM1407 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19655] VGAM1407 gene, herein designated VGAM GENE, encodes a VGAM1407 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1407 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1407 precursor RNA is designated SEQ ID:1393, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1393 is located at position 7313 relative to the genome of acute bee paralysis virus.

[19656] VGAM1407 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1407 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19657] An enzyme complex designated DICER COMPLEX, dices the VGAM1407 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1407 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 68%) nucleotide sequence of VGAM1407 RNA is designated SEQ ID:4118, and is provided hereinbelow with reference to the sequence listing part.

[19658] VGAM1407 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1407 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1407 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19659] VGAM1407 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1407 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1407 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1407 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1407 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19660] The complementary binding of VGAM1407 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1407 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1407 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1407 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19661] It is appreciated that VGAM1407 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1407 host target genes. The mRNA of each one of this plurality of VGAM1407 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1407 RNA, herein designated VGAM RNA, and which when bound by VGAM1407 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1407 host target proteins.

[19662] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1407 gene, herein designated VGAM GENE, on one or more VGAM1407 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19663] It is yet further appreciated that a function of VGAM1407 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1407 include diagnosis, prevention and treatment of viral infection by acute bee paralysis virus. Specific functions, and accordingly utilities, of VGAM1407 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1407 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19664] Nucleotide sequences of the VGAM1407 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1407 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1407 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1407 are further described hereinbelow with reference to Table 1.

[19665] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1407 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19666] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1408 (VGAM1408) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19667] VGAM1408 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1408 was detected is described hereinabove with reference to Figs. 2–8.

[19668] VGAM1408 gene, herein designated VGAM GENE, is a viral gene contained in the genome of acute bee paralysis virus. VGAM1408 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19669] VGAM1408 gene, herein designated VGAM GENE, encodes a VGAM1408 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1408 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1408 precursor RNA is designated SEQ ID:1394, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1394 is located at position 6189 relative to the genome of acute bee paralysis virus.

[19670] VGAM1408 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1408 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19671] An enzyme complex designated DICER COMPLEX, dices the VGAM1408 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1408 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM1408 RNA is designated SEQ ID:4119, and is provided hereinbelow with reference to the sequence listing part.

[19672] VGAM1408 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1408 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1408 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19673] VGAM1408 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1408 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1408 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1408 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1408 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19674] The complementary binding of VGAM1408 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1408 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1408 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1408 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19675] It is appreciated that VGAM1408 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1408 host target genes. The mRNA of each one of this plurality of VGAM1408 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1408 RNA, herein designated VGAM RNA, and which when bound by VGAM1408 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1408 host target proteins.

[19676] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1408 gene, herein designated VGAM GENE, on one or more VGAM1408 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19677] It is yet further appreciated that a function of VGAM1408 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1408 include diagnosis, prevention and treatment of viral infection by acute bee paralysis virus. Specific functions, and accordingly utilities, of VGAM1408

correlate with, and may be deduced from, the identity of the host target genes which VGAM1408 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19678] Nucleotide sequences of the VGAM1408 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1408 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1408 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1408 are further described hereinbelow with reference to Table 1.

[19679] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1408 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19680] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1409 (VGAM1409) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

- [19681] VGAM1409 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1409 was detected is described hereinabove with reference to Figs. 2–8.
- [19682] VGAM1409 gene, herein designated VGAM GENE, is a viral gene contained in the genome of acute bee paralysis virus. VGAM1409 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.
- [19683] VGAM1409 gene, herein designated VGAM GENE, encodes a VGAM1409 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1409 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1409 precursor RNA is designated SEQ ID:1395, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1395 is located at position 9338 relative to the genome of acute bee paralysis virus.
- [19684] VGAM1409 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1409 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19685] An enzyme complex designated DICER COMPLEX, dices the VGAM1409 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1409 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM1409 RNA is designated SEQ ID:4120, and is provided hereinbelow with reference to the sequence listing part.

[19686] VGAM1409 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1409 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1409 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19687] VGAM1409 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1409 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1409 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1409 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1409 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19688] The complementary binding of VGAM1409 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1409 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1409 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1409 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19689] It is appreciated that VGAM1409 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1409 host target genes. The mRNA of each one of this plurality of VGAM1409 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1409 RNA, herein designated VGAM RNA, and which when bound by VGAM1409 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1409 host target proteins.

[19690] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1409 gene, herein designated VGAM GENE, on one or more VGAM1409 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19691] It is yet further appreciated that a function of VGAM1409 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1409 include diagnosis, prevention and treatment of viral infection by acute bee paralysis virus.

Specific functions, and accordingly utilities, of VGAM1409 correlate with, and may be deduced from, the identity of the host target genes which VGAM1409 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19692] Nucleotide sequences of the VGAM1409 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1409 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1409 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1409 are further described hereinbelow with reference to Table 1.

[19693] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1409 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19694] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1410 (VGAM1410) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[19695] VGAM1410 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1410 was detected is described hereinabove with reference to Figs. 2–8.

[19696] VGAM1410 gene, herein designated VGAM GENE, is a viral gene contained in the genome of acute bee paralysis virus. VGAM1410 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19697] VGAM1410 gene, herein designated VGAM GENE, encodes a VGAM1410 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1410 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1410 precursor RNA is designated SEQ ID:1396, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1396 is located at position 8237 relative to the genome of acute bee paralysis virus.

[19698] VGAM1410 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1410 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19699] An enzyme complex designated DICER COMPLEX, dices the VGAM1410 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1410 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1410 RNA is designated SEQ ID:4121, and is provided hereinbelow with reference to the sequence listing part.

[19700] VGAM1410 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1410 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1410 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19701] VGAM1410 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1410 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1410 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1410 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1410 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19702] The complementary binding of VGAM1410 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1410 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1410 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1410 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19703] It is appreciated that VGAM1410 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1410 host target genes. The mRNA of each one of this plurality of VGAM1410 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1410 RNA, herein designated VGAM RNA, and which when bound by VGAM1410 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1410 host target proteins.

[19704] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1410 gene, herein designated VGAM GENE, on one or more VGAM1410 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19705] It is yet further appreciated that a function of VGAM1410 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1410 include diagnosis, prevention and

treatment of viral infection by acute bee paralysis virus. Specific functions, and accordingly utilities, of VGAM1410 correlate with, and may be deduced from, the identity of the host target genes which VGAM1410 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19706] Nucleotide sequences of the VGAM1410 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1410 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1410 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1410 are further described hereinbelow with reference to Table 1.

[19707] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1410 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19708] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1411 (VGAM1411) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19709] VGAM1411 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1411 was detected is described hereinabove with reference to Figs. 2–8.

[19710] VGAM1411 gene, herein designated VGAM GENE, is a viral gene contained in the genome of acute bee paralysis virus. VGAM1411 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19711] VGAM1411 gene, herein designated VGAM GENE, encodes a VGAM1411 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1411 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1411 precursor RNA is designated SEQ ID:1397, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1397 is located at position 3090 relative to the genome of acute bee paralysis virus.

[19712] VGAM1411 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1411 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19713] An enzyme complex designated DICER COMPLEX, dices the VGAM1411 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1411 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1411 RNA is designated SEQ ID:4122, and is provided hereinbelow with reference to the sequence listing part.

[19714] VGAM1411 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1411 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1411 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19715] VGAM1411 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1411 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1411 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1411 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1411 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19716] The complementary binding of VGAM1411 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1411 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1411 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1411 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19717] It is appreciated that VGAM1411 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1411 host target genes. The mRNA of each one of this plurality of VGAM1411 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1411 RNA, herein designated VGAM

RNA, and which when bound by VGAM1411 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1411 host target proteins.

[19718] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1411 gene, herein designated VGAM GENE, on one or more VGAM1411 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19719] It is yet further appreciated that a function of VGAM1411 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1411 include diagnosis, prevention and treatment of viral infection by acute bee paralysis virus. Specific functions, and accordingly utilities, of VGAM1411 correlate with, and may be deduced from, the identity of the host target genes which VGAM1411 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19720] Nucleotide sequences of the VGAM1411 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1411 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1411 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1411 are further described hereinbelow with reference to Table 1.

[19721] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1411 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19722] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1412 (VGAM1412) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19723] VGAM1412 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1412 was detected is described hereinabove with reference to Figs. 2-8.

[19724] VGAM1412 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean yellow mosaic virus. VGAM1412 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19725] VGAM1412 gene, herein designated VGAM GENE, encodes a VGAM1412 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1412 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1412 precursor RNA is designated SEQ ID:1398, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1398 is located at position 555

relative to the genome of Bean yellow mosaic virus.

[19726] VGAM1412 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1412 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19727] An enzyme complex designated DICER COMPLEX, dices the VGAM1412 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1412 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1412 RNA is designated SEQ ID:4123, and is provided hereinbelow with reference to the sequence listing part.

[19728] VGAM1412 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1412 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1412 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19729] VGAM1412 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1412 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1412 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1412 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1412 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19730] The complementary binding of VGAM1412 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1412 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1412 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1412 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19731] It is appreciated that VGAM1412 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1412 host target genes. The mRNA of each one of this plurality of VGAM1412 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1412 RNA, herein designated VGAM RNA, and which when bound by VGAM1412 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1412 host target proteins.

[19732] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1412 gene, herein designated VGAM GENE, on one or more VGAM1412 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19733] It is yet further appreciated that a function of VGAM1412 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1412 include diagnosis, prevention and treatment of viral infection by Bean yellow mosaic virus. Specific functions, and accordingly utilities, of VGAM1412 correlate with, and may be deduced from, the identity of the host target genes which VGAM1412 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19734] Nucleotide sequences of the VGAM1412 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1412 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1412 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1412 are further described hereinbelow with reference to Table 1.

[19735] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1412 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19736] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1413 (VGAM1413) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19737] VGAM1413 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1413 was detected is described hereinabove with reference to Figs. 2–8.

[19738] VGAM1413 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean yellow mosaic virus. VGAM1413 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19739] VGAM1413 gene, herein designated VGAM GENE, encodes a VGAM1413 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1413 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1413 precursor RNA is designated SEQ ID:1399, and is provided hereinbelow with reference to the sequence listing part. Nu–

cleotide sequence SEQ ID:1399 is located at position 4084 relative to the genome of Bean yellow mosaic virus.

[19740] VGAM1413 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1413 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19741] An enzyme complex designated DICER COMPLEX, dices the VGAM1413 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1413 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1413 RNA is designated SEQ ID:4124, and is provided hereinbelow with reference to the sequence

listing part.

[19742] VGAM1413 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1413 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1413 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19743] VGAM1413 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1413 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1413 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1413 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1413 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19744] The complementary binding of VGAM1413 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1413 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1413 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1413 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19745] It is appreciated that VGAM1413 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1413 host target genes. The mRNA of each one of this plurality of VGAM1413 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1413 RNA, herein designated VGAM RNA, and which when bound by VGAM1413 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1413 host target proteins.

[19746] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1413 gene, herein designated VGAM GENE, on one or more VGAM1413 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19747] It is yet further appreciated that a function of VGAM1413

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1413 include diagnosis, prevention and treatment of viral infection by Bean yellow mosaic virus. Specific functions, and accordingly utilities, of VGAM1413 correlate with, and may be deduced from, the identity of the host target genes which VGAM1413 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19748] Nucleotide sequences of the VGAM1413 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1413 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1413 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1413 are further described hereinbelow with reference to Table 1.

[19749] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1413 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19750] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1414 (VGAM1414) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19751] VGAM1414 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1414 was detected is described hereinabove with reference to Figs. 2–8.

[19752] VGAM1414 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean yellow mosaic virus. VGAM1414 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19753] VGAM1414 gene, herein designated VGAM GENE, encodes a VGAM1414 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1414 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1414 precursor RNA is designated SEQ ID:1400, and is provided here–

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1400 is located at position 1603 relative to the genome of Bean yellow mosaic virus.

[19754] VGAM1414 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1414 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19755] An enzyme complex designated DICER COMPLEX, dices the VGAM1414 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1414 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1414 RNA is designated SEQ ID:4125, and

is provided hereinbelow with reference to the sequence listing part.

[19756] VGAM1414 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1414 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1414 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19757] VGAM1414 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1414 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1414 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1414 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1414 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19758] The complementary binding of VGAM1414 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1414 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1414 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1414 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19759] It is appreciated that VGAM1414 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1414 host target genes. The mRNA of each one of this plurality of VGAM1414 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1414 RNA, herein designated VGAM RNA, and which when bound by VGAM1414 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1414 host target proteins.

[19760] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1414 gene, herein designated VGAM GENE, on one or more VGAM1414 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19761] It is yet further appreciated that a function of VGAM1414 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1414 include diagnosis, prevention and treatment of viral infection by Bean yellow mosaic virus. Specific functions, and accordingly utilities, of VGAM1414 correlate with, and may be deduced from, the identity of the host target genes which VGAM1414 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19762] Nucleotide sequences of the VGAM1414 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1414 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1414 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1414 are further described hereinbelow with reference to Table 1.

[19763] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1414 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19764] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1415 (VGAM1415) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19765] VGAM1415 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1415 was detected is described hereinabove with reference to Figs. 2–8.

[19766] VGAM1415 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean yellow mosaic virus. VGAM1415 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19767] VGAM1415 gene, herein designated VGAM GENE, encodes a VGAM1415 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1415 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1415 precu-

sor RNA is designated SEQ ID:1401, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1401 is located at position 1048 relative to the genome of Bean yellow mosaic virus.

[19768] VGAM1415 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1415 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19769] An enzyme complex designated DICER COMPLEX, dices the VGAM1415 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1415 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 67%) nucleotide se-

quence of VGAM1415 RNA is designated SEQ ID:4126, and is provided hereinbelow with reference to the sequence listing part.

[19770] VGAM1415 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1415 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1415 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19771] VGAM1415 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1415 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1415 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1415 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1415 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19772] The complementary binding of VGAM1415 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1415 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1415 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1415 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19773] It is appreciated that VGAM1415 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1415 host target genes. The mRNA of

each one of this plurality of VGAM1415 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1415 RNA, herein designated VGAM RNA, and which when bound by VGAM1415 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1415 host target proteins.

[19774] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1415 gene, herein designated VGAM GENE, on one or more VGAM1415 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[19775] It is yet further appreciated that a function of VGAM1415 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1415 include diagnosis, prevention and treatment of viral infection by Bean yellow mosaic virus. Specific functions, and accordingly utilities, of VGAM1415 correlate with, and may be deduced from, the identity of the host target genes which VGAM1415 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19776] Nucleotide sequences of the VGAM1415 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1415 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1415 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1415 are further described hereinbelow with reference to Table 1.

[19777] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1415 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[19778] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1416 (VGAM1416) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19779] VGAM1416 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1416 was detected is described hereinabove with reference to Figs. 2–8.

[19780] VGAM1416 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ryegrass mosaic virus. VGAM1416 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19781] VGAM1416 gene, herein designated VGAM GENE, encodes a VGAM1416 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1416 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1416 precursor RNA is designated SEQ ID:1402, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1402 is located at position 4175 relative to the genome of Ryegrass mosaic virus.

[19782] VGAM1416 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1416 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19783] An enzyme complex designated DICER COMPLEX, dices the VGAM1416 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1416 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 83%) nucleotide sequence of VGAM1416 RNA is designated SEQ ID:4127, and is provided hereinbelow with reference to the sequence listing part.

[19784] VGAM1416 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1416 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1416 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19785] VGAM1416 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1416 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1416 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1416 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1416 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19786] The complementary binding of VGAM1416 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1416 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1416 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1416 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19787] It is appreciated that VGAM1416 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1416 host target genes. The mRNA of each one of this plurality of VGAM1416 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1416 RNA, herein designated VGAM RNA, and which when bound by VGAM1416 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1416 host target proteins.

[19788] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1416 gene, herein designated VGAM GENE, on one or more VGAM1416 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[19789] It is yet further appreciated that a function of VGAM1416 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1416 include diagnosis, prevention and treatment of viral infection by Ryegrass mosaic virus. Specific functions, and accordingly utilities, of VGAM1416 correlate with, and may be deduced from, the identity of the host target genes which VGAM1416 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19790] Nucleotide sequences of the VGAM1416 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1416 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1416 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1416 are further described hereinbelow with reference to Table 1.

[19791] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1416 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19792] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1417 (VGAM1417) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19793] VGAM1417 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1417 was detected is described hereinabove with reference to Figs. 2-8.

[19794] VGAM1417 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ryegrass mosaic virus. VGAM1417 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19795] VGAM1417 gene, herein designated VGAM GENE, encodes a VGAM1417 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1417 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1417 precursor RNA is designated SEQ ID:1403, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1403 is located at position 5984 relative to the genome of Ryegrass mosaic virus.

[19796] VGAM1417 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1417 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19797] An enzyme complex designated DICER COMPLEX, dices the VGAM1417 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1417 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1417 RNA is designated SEQ ID:4128, and is provided hereinbelow with reference to the sequence listing part.

[19798] VGAM1417 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1417 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1417 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19799] VGAM1417 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1417 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1417 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1417 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1417 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19800] The complementary binding of VGAM1417 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1417 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1417 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1417 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19801] It is appreciated that VGAM1417 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1417 host target genes. The mRNA of each one of this plurality of VGAM1417 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1417 RNA, herein designated VGAM RNA, and which when bound by VGAM1417 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1417 host target proteins.

[19802] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1417 gene, herein designated VGAM GENE, on one or more VGAM1417 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19803] It is yet further appreciated that a function of VGAM1417 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1417 include diagnosis, prevention and treatment of viral infection by Ryegrass mosaic virus. Specific functions, and accordingly utilities, of VGAM1417 correlate with, and may be deduced from, the identity of the host target genes which VGAM1417 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19804] Nucleotide sequences of the VGAM1417 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1417 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1417 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1417 are further described hereinbelow with reference to Table 1.

[19805] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1417 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19806] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1418 (VGAM1418) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19807] VGAM1418 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1418 was detected is described hereinabove with reference to Figs. 2–8.

[19808] VGAM1418 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ryegrass mosaic virus. VGAM1418 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19809] VGAM1418 gene, herein designated VGAM GENE, encodes a VGAM1418 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1418 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1418 precursor RNA is designated SEQ ID:1404, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1404 is located at position 3047 relative to the genome of Ryegrass mosaic virus.

[19810] VGAM1418 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1418 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19811] An enzyme complex designated DICER COMPLEX, dices the VGAM1418 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1418 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1418 RNA is designated SEQ ID:4129, and is provided hereinbelow with reference to the sequence listing part.

[19812] VGAM1418 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1418 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1418 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19813] VGAM1418 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1418 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1418 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1418 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1418 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19814] The complementary binding of VGAM1418 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1418 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1418 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1418 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19815] It is appreciated that VGAM1418 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1418 host target genes. The mRNA of each one of this plurality of VGAM1418 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1418 RNA, herein designated VGAM RNA, and which when bound by VGAM1418 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1418 host target proteins.

[19816] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1418 gene, herein designated VGAM GENE, on one or more VGAM1418 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19817] It is yet further appreciated that a function of VGAM1418 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1418 include diagnosis, prevention and treatment of viral infection by Ryegrass mosaic virus. Specific functions, and accordingly utilities, of VGAM1418 correlate with, and may be deduced from, the identity of the host target genes which VGAM1418 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19818] Nucleotide sequences of the VGAM1418 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1418 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1418 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1418 are further described hereinbelow with reference to Table 1.

[19819] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1418 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19820] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1419 (VGAM1419) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19821] VGAM1419 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1419 was detected is described hereinabove with reference to Figs. 2-8.

[19822] VGAM1419 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ryegrass mosaic virus. VGAM1419 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19823] VGAM1419 gene, herein designated VGAM GENE, encodes a VGAM1419 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1419 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1419 precursor RNA is designated SEQ ID:1405, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1405 is located at position 4295 relative to the genome of Ryegrass mosaic virus.

[19824] VGAM1419 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1419 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19825] An enzyme complex designated DICER COMPLEX, dices the VGAM1419 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1419 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1419 RNA is designated SEQ ID:4130, and is provided hereinbelow with reference to the sequence listing part.

[19826] VGAM1419 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1419 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1419 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19827] VGAM1419 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1419 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1419 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1419 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1419 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19828] The complementary binding of VGAM1419 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1419 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1419 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1419 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[19829] It is appreciated that VGAM1419 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1419 host target genes. The mRNA of each one of this plurality of VGAM1419 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1419 RNA, herein designated VGAM RNA, and which when bound by VGAM1419 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1419 host target proteins.

[19830] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1419 gene, herein designated VGAM GENE, on one or more VGAM1419 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19831] It is yet further appreciated that a function of VGAM1419 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1419 include diagnosis, prevention and treatment of viral infection by Ryegrass mosaic virus. Specific functions, and accordingly utilities, of VGAM1419 correlate with, and may be deduced from, the identity of the host target genes which VGAM1419 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19832] Nucleotide sequences of the VGAM1419 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1419 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1419 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1419 are further described hereinbelow with reference to Table 1.

[19833] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1419 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19834] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1420 (VGAM1420) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19835] VGAM1420 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1420 was detected is described hereinabove with reference to Figs. 2-8.

[19836] VGAM1420 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB virus A. VGAM1420 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19837] VGAM1420 gene, herein designated VGAM GENE, encodes a VGAM1420 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1420 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1420 precursor RNA is designated SEQ ID:1406, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1406 is located at position 4594 relative to the genome of Hepatitis GB virus A.

[19838] VGAM1420 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1420 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19839] An enzyme complex designated DICER COMPLEX, dices the VGAM1420 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1420 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of VGAM1420 RNA is designated SEQ ID:4131, and is provided hereinbelow with reference to the sequence listing part.

[19840] VGAM1420 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1420 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1420 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19841] VGAM1420 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1420 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1420 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1420 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1420 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19842] The complementary binding of VGAM1420 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1420 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1420 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1420 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19843] It is appreciated that VGAM1420 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1420 host target genes. The mRNA of each one of this plurality of VGAM1420 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1420 RNA, herein designated VGAM RNA, and which when bound by VGAM1420 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1420 host target proteins.

[19844] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1420 gene, herein designated VGAM GENE, on one or more VGAM1420 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19845] It is yet further appreciated that a function of VGAM1420 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1420 include diagnosis, prevention and treatment of viral infection by Hepatitis GB virus A. Specific functions, and accordingly utilities, of VGAM1420 correlate with, and may be deduced from, the identity of the host target genes which VGAM1420 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19846] Nucleotide sequences of the VGAM1420 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1420 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1420 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1420 are further described hereinbelow with reference to Table 1.

[19847] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1420 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19848] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1421 (VGAM1421) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19849] VGAM1421 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1421 was detected is described hereinabove with reference to Figs. 2-8.

[19850] VGAM1421 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB virus A. VGAM1421 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19851] VGAM1421 gene, herein designated VGAM GENE, encodes

a VGAM1421 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1421 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1421 precursor RNA is designated SEQ ID:1407, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1407 is located at position 2844 relative to the genome of Hepatitis GB virus A.

[19852] VGAM1421 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1421 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19853] An enzyme complex designated DICER COMPLEX, dices the VGAM1421 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1421 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1421 RNA is designated SEQ ID:4132, and is provided hereinbelow with reference to the sequence listing part.

[19854] VGAM1421 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1421 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1421 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19855] VGAM1421 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1421 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1421 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1421 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1421 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19856] The complementary binding of VGAM1421 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1421 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1421 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1421 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19857] It is appreciated that VGAM1421 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1421 host target genes. The mRNA of each one of this plurality of VGAM1421 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1421 RNA, herein designated VGAM RNA, and which when bound by VGAM1421 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1421 host target proteins.

[19858] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1421 gene, herein designated VGAM GENE, on one or more VGAM1421 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19859] It is yet further appreciated that a function of VGAM1421 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1421 include diagnosis, prevention and treatment of viral infection by Hepatitis GB virus A. Specific functions, and accordingly utilities, of VGAM1421 correlate with, and may be deduced from, the identity of the host target genes which VGAM1421 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19860] Nucleotide sequences of the VGAM1421 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM1421 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1421 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1421 are further

described hereinbelow with reference to Table 1.

[19861] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1421 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19862] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1422 (VGAM1422) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19863] VGAM1422 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1422 was detected is described hereinabove with reference to Figs. 2-8.

[19864] VGAM1422 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB virus A. VGAM1422 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19865] VGAM1422 gene, herein designated VGAM GENE, encodes a VGAM1422 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1422 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1422 precursor RNA is designated SEQ ID:1408, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1408 is located at position 1070 relative to the genome of Hepatitis GB virus A.

[19866] VGAM1422 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1422 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19867] An enzyme complex designated DICER COMPLEX, dices the VGAM1422 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1422 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1422 RNA is designated SEQ ID:4133, and is provided hereinbelow with reference to the sequence listing part.

[19868] VGAM1422 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1422 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1422 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19869] VGAM1422 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1422 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1422 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1422 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1422 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19870] The complementary binding of VGAM1422 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1422 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1422

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1422 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19871] It is appreciated that VGAM1422 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1422 host target genes. The mRNA of each one of this plurality of VGAM1422 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1422 RNA, herein designated VGAM RNA, and which when bound by VGAM1422 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1422 host target proteins.

[19872] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1422 gene, herein designated VGAM GENE, on one or more VGAM1422 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19873] It is yet further appreciated that a function of VGAM1422 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1422 include diagnosis, prevention and treatment of viral infection by Hepatitis GB virus A. Specific functions, and accordingly utilities, of VGAM1422 correlate with, and may be deduced from, the identity of the host target genes which VGAM1422 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19874] Nucleotide sequences of the VGAM1422 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1422 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1422 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1422 are further described hereinbelow with reference to Table 1.

[19875] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1422 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19876] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1423 (VGAM1423) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19877] VGAM1423 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1423 was detected is described hereinabove with reference to Figs. 2-8.

[19878] VGAM1423 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB virus A. VGAM1423 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[19879] VGAM1423 gene, herein designated VGAM GENE, encodes a VGAM1423 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1423 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1423 precursor RNA is designated SEQ ID:1409, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1409 is located at position 8372 relative to the genome of Hepatitis GB virus A.

[19880] VGAM1423 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1423 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19881] An enzyme complex designated DICER COMPLEX, dices

the VGAM1423 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1423 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1423 RNA is designated SEQ ID:4134, and is provided hereinbelow with reference to the sequence listing part.

[19882] VGAM1423 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1423 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1423 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19883] VGAM1423 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1423 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1423 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1423 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1423 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19884] The complementary binding of VGAM1423 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1423 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1423 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1423 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19885] It is appreciated that VGAM1423 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1423 host target genes. The mRNA of each one of this plurality of VGAM1423 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1423 RNA, herein designated VGAM RNA, and which when bound by VGAM1423 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1423 host target proteins.

[19886] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1423 gene, herein designated VGAM GENE, on one or more VGAM1423 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19887] It is yet further appreciated that a function of VGAM1423 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1423 include diagnosis, prevention and treatment of viral infection by Hepatitis GB virus A. Specific functions, and accordingly utilities, of VGAM1423 correlate with, and may be deduced from, the identity of the host target genes which VGAM1423 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19888] Nucleotide sequences of the VGAM1423 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1423 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1423 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1423 are further described hereinbelow with reference to Table 1.

[19889] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1423 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19890] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1424 (VGAM1424) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19891] VGAM1424 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1424 was detected is described hereinabove with reference to Figs. 2-8.

[19892] VGAM1424 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Clover yellow vein virus. VGAM1424 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[19893] VGAM1424 gene, herein designated VGAM GENE, encodes a VGAM1424 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1424 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1424 precursor RNA is designated SEQ ID:1410, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1410 is located at position 1464 relative to the genome of Clover yellow vein virus.

[19894] VGAM1424 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1424 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19895] An enzyme complex designated DICER COMPLEX, dices the VGAM1424 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1424 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1424 RNA is designated SEQ ID:4135, and is provided hereinbelow with reference to the sequence listing part.

[19896] VGAM1424 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1424 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1424 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19897] VGAM1424 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1424 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1424 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1424 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1424 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19898] The complementary binding of VGAM1424 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1424 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1424 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1424 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19899] It is appreciated that VGAM1424 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1424 host target genes. The mRNA of each one of this plurality of VGAM1424 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1424 RNA, herein designated VGAM RNA, and which when bound by VGAM1424 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1424 host target proteins.

[19900] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1424 gene, herein designated VGAM GENE, on one or more VGAM1424 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19901] It is yet further appreciated that a function of VGAM1424 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1424 include diagnosis, prevention and treatment of viral infection by Clover yellow vein virus. Specific functions, and accordingly utilities, of VGAM1424 correlate with, and may be deduced from, the identity of the host target genes which VGAM1424 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19902] Nucleotide sequences of the VGAM1424 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1424 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1424 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1424 are further described hereinbelow with reference to Table 1.

[19903] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1424 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19904] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1425 (VGAM1425) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19905] VGAM1425 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1425 was detected is described hereinabove with reference to Figs. 2-8.

[19906] VGAM1425 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Clover yellow vein virus.

VGAM1425 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19907] VGAM1425 gene, herein designated VGAM GENE, encodes a VGAM1425 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1425 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1425 precursor RNA is designated SEQ ID:1411, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1411 is located at position 767 relative to the genome of Clover yellow vein virus.

[19908] VGAM1425 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1425 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[19909] An enzyme complex designated DICER COMPLEX, dices the VGAM1425 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1425 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1425 RNA is designated SEQ ID:4136, and is provided hereinbelow with reference to the sequence listing part.

[19910] VGAM1425 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1425 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1425 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19911] VGAM1425 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1425 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1425 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1425 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1425 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19912] The complementary binding of VGAM1425 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1425 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1425 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1425 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19913] It is appreciated that VGAM1425 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1425 host target genes. The mRNA of each one of this plurality of VGAM1425 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1425 RNA, herein designated VGAM RNA, and which when bound by VGAM1425 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1425 host target proteins.

[19914] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1425 gene, herein designated VGAM GENE, on one or more VGAM1425 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19915] It is yet further appreciated that a function of VGAM1425 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1425 include diagnosis, prevention and treatment of viral infection by Clover yellow vein virus. Specific functions, and accordingly utilities, of VGAM1425 correlate with, and may be deduced from, the identity of the host target genes which VGAM1425 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19916] Nucleotide sequences of the VGAM1425 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1425 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1425 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1425 are further described hereinbelow with reference to Table 1.

[19917] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1425 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19918] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1426 (VGAM1426) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19919] VGAM1426 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1426 was detected is described hereinabove with reference to Figs. 2-8.

[19920] VGAM1426 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Clover yellow vein virus. VGAM1426 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19921] VGAM1426 gene, herein designated VGAM GENE, encodes a VGAM1426 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1426 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1426 precursor RNA is designated SEQ ID:1412, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1412 is located at position 8366 relative to the genome of Clover yellow vein virus.

[19922] VGAM1426 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1426 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19923] An enzyme complex designated DICER COMPLEX, dices the VGAM1426 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1426 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1426 RNA is designated SEQ ID:4137, and is provided hereinbelow with reference to the sequence listing part.

[19924] VGAM1426 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1426 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1426 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19925] VGAM1426 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1426 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1426 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1426 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1426 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19926] The complementary binding of VGAM1426 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1426 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1426 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1426 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19927] It is appreciated that VGAM1426 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1426 host target genes. The mRNA of each one of this plurality of VGAM1426 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1426 RNA, herein designated VGAM RNA, and which when bound by VGAM1426 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1426 host target proteins.

[19928] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1426 gene, herein designated VGAM GENE, on one or more VGAM1426 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19929] It is yet further appreciated that a function of VGAM1426 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1426 include diagnosis, prevention and treatment of viral infection by Clover yellow vein virus. Specific functions, and accordingly utilities, of VGAM1426 correlate with, and may be deduced from, the identity of the host target genes which VGAM1426 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19930] Nucleotide sequences of the VGAM1426 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1426 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1426 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1426 are further described hereinbelow with reference to Table 1.

[19931] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1426 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19932] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1427 (VGAM1427) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19933] VGAM1427 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1427 was detected is described hereinabove with reference to Figs. 2-8.

[19934] VGAM1427 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Clover yellow vein virus. VGAM1427 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19935] VGAM1427 gene, herein designated VGAM GENE, encodes a VGAM1427 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1427 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1427 precursor RNA is designated SEQ ID:1413, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1413 is located at position 8119 relative to the genome of Clover yellow vein virus.

[19936] VGAM1427 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1427 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19937] An enzyme complex designated DICER COMPLEX, dices the VGAM1427 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1427 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1427 RNA is designated SEQ ID:4138, and is provided hereinbelow with reference to the sequence listing part.

[19938] VGAM1427 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1427 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1427 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[19939] VGAM1427 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1427 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1427 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1427 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1427 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19940] The complementary binding of VGAM1427 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1427 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1427 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1427 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19941] It is appreciated that VGAM1427 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1427 host target genes. The mRNA of each one of this plurality of VGAM1427 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1427 RNA, herein designated VGAM RNA, and which when bound by VGAM1427 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1427 host target proteins.

[19942] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1427 gene, herein designated VGAM GENE, on one

or more VGAM1427 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19943] It is yet further appreciated that a function of VGAM1427 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1427 include diagnosis, prevention and treatment of viral infection by Clover yellow vein virus. Specific functions, and accordingly utilities, of VGAM1427 correlate with, and may be deduced from, the identity of the host target genes which VGAM1427 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19944] Nucleotide sequences of the VGAM1427 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1427 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1427 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1427 are further described hereinbelow with reference to Table 1.

[19945] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1427 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19946] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1428 (VGAM1428) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19947] VGAM1428 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1428 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[19948] VGAM1428 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Clover yellow vein virus. VGAM1428 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19949] VGAM1428 gene, herein designated VGAM GENE, encodes a VGAM1428 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1428 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1428 precursor RNA is designated SEQ ID:1414, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1414 is located at position 1573 relative to the genome of Clover yellow vein virus.

[19950] VGAM1428 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1428 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19951] An enzyme complex designated DICER COMPLEX, dices the VGAM1428 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1428 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1428 RNA is designated SEQ ID:4139, and is provided hereinbelow with reference to the sequence listing part.

[19952] VGAM1428 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1428 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1428 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19953] VGAM1428 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1428 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1428 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1428 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1428 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[19954] The complementary binding of VGAM1428 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1428 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1428 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1428 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19955] It is appreciated that VGAM1428 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1428 host target genes. The mRNA of each one of this plurality of VGAM1428 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1428 RNA, herein designated VGAM RNA, and which when bound by VGAM1428 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1428 host target proteins.

[19956] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1428 gene, herein designated VGAM GENE, on one or more VGAM1428 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19957] It is yet further appreciated that a function of VGAM1428 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1428 include diagnosis, prevention and treatment of viral infection by Clover yellow vein virus. Specific functions, and accordingly utilities, of VGAM1428 correlate with, and may be deduced from, the identity of the host target genes which VGAM1428 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[19958] Nucleotide sequences of the VGAM1428 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1428 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1428 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1428 are further described hereinbelow with reference to Table 1.

[19959] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1428 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19960] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1429 (VGAM1429) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19961] VGAM1429 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1429 was detected is described hereinabove with reference to Figs. 2–8.

[19962] VGAM1429 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Clover yellow vein virus. VGAM1429 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19963] VGAM1429 gene, herein designated VGAM GENE, encodes a VGAM1429 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1429 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1429 precursor RNA is designated SEQ ID:1415, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1415 is located at position 913 relative to the genome of Clover yellow vein virus.

[19964] VGAM1429 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1429 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19965] An enzyme complex designated DICER COMPLEX, dices the VGAM1429 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1429 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1429 RNA is designated SEQ ID:4140, and is provided hereinbelow with reference to the sequence listing part.

[19966] VGAM1429 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1429 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1429 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19967] VGAM1429 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1429 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1429 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1429 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1429 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19968] The complementary binding of VGAM1429 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1429 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1429 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1429 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19969] It is appreciated that VGAM1429 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1429 host target genes. The mRNA of each one of this plurality of VGAM1429 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1429 RNA, herein designated VGAM RNA, and which when bound by VGAM1429 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1429 host target proteins.

[19970] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1429 gene, herein designated VGAM GENE, on one or more VGAM1429 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19971] It is yet further appreciated that a function of VGAM1429 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1429 include diagnosis, prevention and treatment of viral infection by Clover yellow vein virus. Specific functions, and accordingly utilities, of VGAM1429 correlate with, and may be deduced from, the identity of the host target genes which VGAM1429 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[19972] Nucleotide sequences of the VGAM1429 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1429 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1429 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1429 are further described hereinbelow with reference to Table 1.

[19973] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1429 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19974] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1430 (VGAM1430) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19975] VGAM1430 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1430 was detected is described hereinabove with reference to Figs. 2–8.

[19976] VGAM1430 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Clover yellow vein virus. VGAM1430 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19977] VGAM1430 gene, herein designated VGAM GENE, encodes a VGAM1430 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1430 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1430 precursor RNA is designated SEQ ID:1416, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1416 is located at position 6030 relative to the genome of Clover yellow vein virus.

[19978] VGAM1430 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1430 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19979] An enzyme complex designated DICER COMPLEX, dices the VGAM1430 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1430 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of VGAM1430 RNA is designated SEQ ID:4141, and is provided hereinbelow with reference to the sequence listing part.

[19980] VGAM1430 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1430 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1430 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19981] VGAM1430 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1430 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1430 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1430 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1430 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19982] The complementary binding of VGAM1430 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1430 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1430 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1430 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19983] It is appreciated that VGAM1430 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1430 host target genes. The mRNA of each one of this plurality of VGAM1430 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1430 RNA, herein designated VGAM RNA, and which when bound by VGAM1430 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1430 host target proteins.

[19984] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1430 gene, herein designated VGAM GENE, on one or more VGAM1430 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19985] It is yet further appreciated that a function of VGAM1430 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1430 include diagnosis, prevention and treatment of viral infection by Clover yellow vein virus. Specific functions, and accordingly utilities, of VGAM1430 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1430 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19986] Nucleotide sequences of the VGAM1430 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1430 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1430 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1430 are further described hereinbelow with reference to Table 1.

[19987] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1430 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19988] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1431 (VGAM1431) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

- [19989] VGAM1431 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1431 was detected is described hereinabove with reference to Figs. 2–8.
- [19990] VGAM1431 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato virus A. VGAM1431 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.
- [19991] VGAM1431 gene, herein designated VGAM GENE, encodes a VGAM1431 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1431 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1431 precursor RNA is designated SEQ ID:1417, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1417 is located at position 4277 relative to the genome of Potato virus A.
- [19992] VGAM1431 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1431 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19993] An enzyme complex designated DICER COMPLEX, dices the VGAM1431 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1431 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM1431 RNA is designated SEQ ID:4142, and is provided hereinbelow with reference to the sequence listing part.

[19994] VGAM1431 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1431 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1431 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[19995] VGAM1431 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1431 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1431 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1431 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1431 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[19996] The complementary binding of VGAM1431 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1431 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1431 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1431 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19997] It is appreciated that VGAM1431 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1431 host target genes. The mRNA of each one of this plurality of VGAM1431 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1431 RNA, herein designated VGAM RNA, and which when bound by VGAM1431 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1431 host target proteins.

[19998] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1431 gene, herein designated VGAM GENE, on one or more VGAM1431 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[19999] It is yet further appreciated that a function of VGAM1431 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1431 include diagnosis, prevention and treatment of viral infection by Potato virus A. Specific functions, and accordingly utilities, of VGAM1431 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM1431 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20000] Nucleotide sequences of the VGAM1431 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1431 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1431 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1431 are further described hereinbelow with reference to Table 1.

[20001] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1431 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20002] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1432 (VGAM1432) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[20003] VGAM1432 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1432 was detected is described hereinabove with reference to Figs. 2–8.

[20004] VGAM1432 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato virus A. VGAM1432 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20005] VGAM1432 gene, herein designated VGAM GENE, encodes a VGAM1432 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1432 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1432 precursor RNA is designated SEQ ID:1418, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1418 is located at position 462 relative to the genome of Potato virus A.

[20006] VGAM1432 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1432 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20007] An enzyme complex designated DICER COMPLEX, dices the VGAM1432 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1432 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1432 RNA is designated SEQ ID:4143, and is provided hereinbelow with reference to the sequence listing part.

[20008] VGAM1432 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1432 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1432 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20009] VGAM1432 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1432 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1432 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1432 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1432 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20010] The complementary binding of VGAM1432 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1432 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1432 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1432 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20011] It is appreciated that VGAM1432 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1432 host target genes. The mRNA of each one of this plurality of VGAM1432 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1432 RNA, herein designated VGAM RNA, and which when bound by VGAM1432 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1432 host target proteins.

[20012] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1432 gene, herein designated VGAM GENE, on one or more VGAM1432 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20013] It is yet further appreciated that a function of VGAM1432 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1432 include diagnosis, prevention and treatment of viral infection by Potato virus A. Specific

functions, and accordingly utilities, of VGAM1432 correlate with, and may be deduced from, the identity of the host target genes which VGAM1432 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20014] Nucleotide sequences of the VGAM1432 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1432 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1432 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1432 are further described hereinbelow with reference to Table 1.

[20015] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1432 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20016] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1433 (VGAM1433) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[20017] VGAM1433 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1433 was detected is described hereinabove with reference to Figs. 2–8.

[20018] VGAM1433 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato virus A. VGAM1433 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20019] VGAM1433 gene, herein designated VGAM GENE, encodes a VGAM1433 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1433 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1433 precursor RNA is designated SEQ ID:1419, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1419 is located at position 3612 relative to the genome of Potato virus A.

[20020] VGAM1433 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1433 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20021] An enzyme complex designated DICER COMPLEX, dices the VGAM1433 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1433 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM1433 RNA is designated SEQ ID:4144, and is provided hereinbelow with reference to the sequence listing part.

[20022] VGAM1433 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1433 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1433 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20023] VGAM1433 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1433 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1433 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1433 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1433 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20024] The complementary binding of VGAM1433 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1433 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1433 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1433 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20025] It is appreciated that VGAM1433 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1433 host target genes. The mRNA of each one of this plurality of VGAM1433 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1433 RNA, herein designated VGAM RNA, and which when bound by VGAM1433 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1433 host target proteins.

[20026] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1433 gene, herein designated VGAM GENE, on one or more VGAM1433 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20027] It is yet further appreciated that a function of VGAM1433 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1433 include diagnosis, prevention and

treatment of viral infection by Potato virus A. Specific functions, and accordingly utilities, of VGAM1433 correlate with, and may be deduced from, the identity of the host target genes which VGAM1433 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20028] Nucleotide sequences of the VGAM1433 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1433 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1433 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1433 are further described hereinbelow with reference to Table 1.

[20029] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1433 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20030] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1434 (VGAM1434) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20031] VGAM1434 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1434 was detected is described hereinabove with reference to Figs. 2–8.

[20032] VGAM1434 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato virus A. VGAM1434 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20033] VGAM1434 gene, herein designated VGAM GENE, encodes a VGAM1434 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1434 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1434 precursor RNA is designated SEQ ID:1420, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1420 is located at position 3882 relative to the genome of Potato virus A.

[20034] VGAM1434 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1434 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20035] An enzyme complex designated DICER COMPLEX, dices the VGAM1434 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1434 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1434 RNA is designated SEQ ID:4145, and is provided hereinbelow with reference to the sequence listing part.

[20036] VGAM1434 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1434 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1434 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20037] VGAM1434 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1434 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1434 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1434 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1434 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20038] The complementary binding of VGAM1434 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1434 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1434 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1434 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20039] It is appreciated that VGAM1434 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1434 host target genes. The mRNA of each one of this plurality of VGAM1434 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1434 RNA, herein designated VGAM

RNA, and which when bound by VGAM1434 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1434 host target proteins.

[20040] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1434 gene, herein designated VGAM GENE, on one or more VGAM1434 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20041] It is yet further appreciated that a function of VGAM1434 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1434 include diagnosis, prevention and treatment of viral infection by Potato virus A. Specific functions, and accordingly utilities, of VGAM1434 correlate with, and may be deduced from, the identity of the host target genes which VGAM1434 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20042] Nucleotide sequences of the VGAM1434 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1434 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1434 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1434 are further described hereinbelow with reference to Table 1.

[20043] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1434 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20044] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1435 (VGAM1435) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20045] VGAM1435 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1435 was detected is described hereinabove with reference to Figs. 2-8.

[20046] VGAM1435 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato virus A. VGAM1435 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20047] VGAM1435 gene, herein designated VGAM GENE, encodes a VGAM1435 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1435 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1435 precursor RNA is designated SEQ ID:1421, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1421 is located at position 7490

relative to the genome of Potato virus A.

[20048] VGAM1435 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1435 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20049] An enzyme complex designated DICER COMPLEX, dices the VGAM1435 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1435 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1435 RNA is designated SEQ ID:4146, and is provided hereinbelow with reference to the sequence listing part.

[20050] VGAM1435 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1435 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1435 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20051] VGAM1435 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1435 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1435 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1435 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1435 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20052] The complementary binding of VGAM1435 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1435 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1435 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1435 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20053] It is appreciated that VGAM1435 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1435 host target genes. The mRNA of each one of this plurality of VGAM1435 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1435 RNA, herein designated VGAM RNA, and which when bound by VGAM1435 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1435 host target proteins.

[20054] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1435 gene, herein designated VGAM GENE, on one or more VGAM1435 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20055] It is yet further appreciated that a function of VGAM1435 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1435 include diagnosis, prevention and treatment of viral infection by Potato virus A. Specific functions, and accordingly utilities, of VGAM1435 correlate with, and may be deduced from, the identity of the host target genes which VGAM1435 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20056] Nucleotide sequences of the VGAM1435 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1435 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1435 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1435 are further described hereinbelow with reference to Table 1.

[20057] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1435 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20058] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1436 (VGAM1436) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20059] VGAM1436 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1436 was detected is described hereinabove with reference to Figs. 2–8.

[20060] VGAM1436 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato virus A. VGAM1436 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20061] VGAM1436 gene, herein designated VGAM GENE, encodes a VGAM1436 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1436 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1436 precursor RNA is designated SEQ ID:1422, and is provided hereinbelow with reference to the sequence listing part. Nu–

cleotide sequence SEQ ID:1422 is located at position 6614 relative to the genome of Potato virus A.

[20062] VGAM1436 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1436 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20063] An enzyme complex designated DICER COMPLEX, dices the VGAM1436 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1436 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM1436 RNA is designated SEQ ID:4147, and is provided hereinbelow with reference to the sequence

listing part.

[20064] VGAM1436 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1436 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1436 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20065] VGAM1436 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1436 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1436 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1436 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1436 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20066] The complementary binding of VGAM1436 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1436 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1436 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1436 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20067] It is appreciated that VGAM1436 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1436 host target genes. The mRNA of each one of this plurality of VGAM1436 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1436 RNA, herein designated VGAM RNA, and which when bound by VGAM1436 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1436 host target proteins.

[20068] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1436 gene, herein designated VGAM GENE, on one or more VGAM1436 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20069] It is yet further appreciated that a function of VGAM1436

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1436 include diagnosis, prevention and treatment of viral infection by Potato virus A. Specific functions, and accordingly utilities, of VGAM1436 correlate with, and may be deduced from, the identity of the host target genes which VGAM1436 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20070] Nucleotide sequences of the VGAM1436 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1436 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1436 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1436 are further described hereinbelow with reference to Table 1.

[20071] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1436 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20072] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1437 (VGAM1437) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20073] VGAM1437 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1437 was detected is described hereinabove with reference to Figs. 2–8.

[20074] VGAM1437 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato virus A. VGAM1437 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20075] VGAM1437 gene, herein designated VGAM GENE, encodes a VGAM1437 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1437 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1437 precursor RNA is designated SEQ ID:1423, and is provided here–

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1423 is located at position 26 relative to the genome of Potato virus A.

[20076] VGAM1437 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1437 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20077] An enzyme complex designated DICER COMPLEX, dices the VGAM1437 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1437 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM1437 RNA is designated SEQ ID:4148, and

is provided hereinbelow with reference to the sequence listing part.

[20078] VGAM1437 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1437 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1437 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20079] VGAM1437 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1437 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1437 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1437 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1437 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20080] The complementary binding of VGAM1437 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1437 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1437 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1437 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20081] It is appreciated that VGAM1437 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1437 host target genes. The mRNA of each one of this plurality of VGAM1437 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1437 RNA, herein designated VGAM RNA, and which when bound by VGAM1437 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1437 host target proteins.

[20082] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1437 gene, herein designated VGAM GENE, on one or more VGAM1437 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20083] It is yet further appreciated that a function of VGAM1437 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1437 include diagnosis, prevention and treatment of viral infection by Potato virus A. Specific functions, and accordingly utilities, of VGAM1437 correlate with, and may be deduced from, the identity of the host target genes which VGAM1437 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20084] Nucleotide sequences of the VGAM1437 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1437 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1437 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1437 are further described hereinbelow with reference to Table 1.

[20085] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1437 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20086] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1438 (VGAM1438) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20087] VGAM1438 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1438 was detected is described hereinabove with reference to Figs. 2–8.

[20088] VGAM1438 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean common mosaic necrosis virus. VGAM1438 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20089] VGAM1438 gene, herein designated VGAM GENE, encodes a VGAM1438 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1438 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1438 precu-

sor RNA is designated SEQ ID:1424, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1424 is located at position 7374 relative to the genome of Bean common mosaic necrosis virus.

[20090] VGAM1438 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1438 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20091] An enzyme complex designated DICER COMPLEX, dices the VGAM1438 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1438 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1438 RNA is designated SEQ ID:4149, and is provided hereinbelow with reference to the sequence listing part.

[20092] VGAM1438 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1438 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1438 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20093] VGAM1438 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1438 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1438 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1438 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1438 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20094] The complementary binding of VGAM1438 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1438 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1438 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1438 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20095] It is appreciated that VGAM1438 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1438 host target genes. The mRNA of each one of this plurality of VGAM1438 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1438 RNA, herein designated VGAM RNA, and which when bound by VGAM1438 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1438 host target proteins.

[20096] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1438 gene, herein designated VGAM GENE, on one or more VGAM1438 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[20097] It is yet further appreciated that a function of VGAM1438 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1438 include diagnosis, prevention and treatment of viral infection by Bean common mosaic necrosis virus. Specific functions, and accordingly utilities, of VGAM1438 correlate with, and may be deduced from, the identity of the host target genes which VGAM1438 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20098] Nucleotide sequences of the VGAM1438 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1438 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1438 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1438 are further described hereinbelow with reference to Table 1.

[20099] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1438 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20100] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1439 (VGAM1439) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20101] VGAM1439 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1439 was detected is described hereinabove with reference to Figs. 2-8.

[20102] VGAM1439 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean common mosaic necrosis virus. VGAM1439 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20103] VGAM1439 gene, herein designated VGAM GENE, encodes a VGAM1439 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1439 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1439 precursor RNA is designated SEQ ID:1425, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1425 is located at position 4013 relative to the genome of Bean common mosaic necrosis virus.

[20104] VGAM1439 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1439 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20105] An enzyme complex designated DICER COMPLEX, dices the VGAM1439 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1439 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1439 RNA is designated SEQ ID:4150, and is provided hereinbelow with reference to the sequence listing part.

[20106] VGAM1439 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1439 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1439 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20107] VGAM1439 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1439 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1439 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1439 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1439 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20108] The complementary binding of VGAM1439 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1439 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1439 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1439 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20109] It is appreciated that VGAM1439 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1439 host target genes. The mRNA of each one of this plurality of VGAM1439 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1439 RNA, herein designated VGAM RNA, and which when bound by VGAM1439 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1439 host target proteins.

[20110] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1439 gene, herein designated VGAM GENE, on one or more VGAM1439 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20111] It is yet further appreciated that a function of VGAM1439 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1439 include diagnosis, prevention and treatment of viral infection by Bean common mosaic necrosis virus. Specific functions, and accordingly utilities, of VGAM1439 correlate with, and may be deduced from, the identity of the host target genes which VGAM1439 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20112] Nucleotide sequences of the VGAM1439 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1439 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1439 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1439 are further described hereinbelow with reference to Table 1.

[20113] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1439 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20114] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1440 (VGAM1440) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20115] VGAM1440 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1440 was detected is described hereinabove with reference to Figs. 2-8.

[20116] VGAM1440 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean common mosaic necrosis virus. VGAM1440 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20117] VGAM1440 gene, herein designated VGAM GENE, encodes a VGAM1440 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1440 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1440 precursor RNA is designated SEQ ID:1426, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1426 is located at position 5334 relative to the genome of Bean common mosaic necrosis virus.

[20118] VGAM1440 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1440 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20119] An enzyme complex designated DICER COMPLEX, dices the VGAM1440 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1440 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM1440 RNA is designated SEQ ID:4151, and is provided hereinbelow with reference to the sequence listing part.

[20120] VGAM1440 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1440 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1440 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20121] VGAM1440 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1440 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1440 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1440 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1440 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20122] The complementary binding of VGAM1440 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1440 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1440 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1440 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20123] It is appreciated that VGAM1440 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1440 host target genes. The mRNA of each one of this plurality of VGAM1440 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1440 RNA, herein designated VGAM RNA, and which when bound by VGAM1440 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1440 host target proteins.

[20124] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1440 gene, herein designated VGAM GENE, on one or more VGAM1440 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20125] It is yet further appreciated that a function of VGAM1440 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1440 include diagnosis, prevention and treatment of viral infection by Bean common mosaic necrosis virus. Specific functions, and accordingly utilities, of VGAM1440 correlate with, and may be deduced from, the identity of the host target genes which VGAM1440 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20126] Nucleotide sequences of the VGAM1440 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1440 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1440 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1440 are further described hereinbelow with reference to Table 1.

[20127] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1440 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20128] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1441 (VGAM1441) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20129] VGAM1441 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1441 was detected is described hereinabove with reference to Figs. 2-8.

[20130] VGAM1441 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean common mosaic necrosis virus. VGAM1441 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20131] VGAM1441 gene, herein designated VGAM GENE, encodes

a VGAM1441 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1441 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1441 precursor RNA is designated SEQ ID:1427, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1427 is located at position 5472 relative to the genome of Bean common mosaic necrosis virus.

[20132] VGAM1441 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1441 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20133] An enzyme complex designated DICER COMPLEX, dices the VGAM1441 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1441 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1441 RNA is designated SEQ ID:4152, and is provided hereinbelow with reference to the sequence listing part.

[20134] VGAM1441 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1441 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1441 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20135] VGAM1441 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1441 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1441 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1441 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1441 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20136] The complementary binding of VGAM1441 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1441 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1441

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1441 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20137] It is appreciated that VGAM1441 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1441 host target genes. The mRNA of each one of this plurality of VGAM1441 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1441 RNA, herein designated VGAM RNA, and which when bound by VGAM1441 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1441 host target proteins.

[20138] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1441 gene, herein designated VGAM GENE, on one or more VGAM1441 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20139] It is yet further appreciated that a function of VGAM1441 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1441 include diagnosis, prevention and treatment of viral infection by Bean common mosaic necrosis virus. Specific functions, and accordingly utilities, of VGAM1441 correlate with, and may be deduced from, the identity of the host target genes which VGAM1441 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20140] Nucleotide sequences of the VGAM1441 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1441 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1441 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1441 are further described hereinbelow with reference to Table 1.

[20141] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1441 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20142] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1442 (VGAM1442) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20143] VGAM1442 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1442 was detected is described hereinabove with reference to Figs. 2-8.

[20144] VGAM1442 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean common mosaic necrosis virus. VGAM1442 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene con-

tained in the human genome.

[20145] VGAM1442 gene, herein designated VGAM GENE, encodes a VGAM1442 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1442 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1442 precursor RNA is designated SEQ ID:1428, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1428 is located at position 7222 relative to the genome of Bean common mosaic necrosis virus.

[20146] VGAM1442 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1442 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20147] An enzyme complex designated DICER COMPLEX, dices the VGAM1442 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1442 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1442 RNA is designated SEQ ID:4153, and is provided hereinbelow with reference to the sequence listing part.

[20148] VGAM1442 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1442 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1442 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20149] VGAM1442 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1442 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1442 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1442 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1442 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20150] The complementary binding of VGAM1442 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1442 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1442 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1442 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20151] It is appreciated that VGAM1442 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1442 host target genes. The mRNA of each one of this plurality of VGAM1442 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1442 RNA, herein designated VGAM RNA, and which when bound by VGAM1442 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1442 host target proteins.

[20152] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1442 gene, herein designated VGAM GENE, on one or more VGAM1442 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20153] It is yet further appreciated that a function of VGAM1442 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of viral infection by Bean common mosaic necrosis virus. Specific functions, and accordingly utilities, of VGAM1442 correlate with, and may be deduced from, the identity of the host target genes which VGAM1442 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20154] Nucleotide sequences of the VGAM1442 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1442 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1442 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1442 are further described hereinbelow with reference to Table 1.

[20155] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1442 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20156] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1443 (VGAM1443) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20157] VGAM1443 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1443 was detected is described hereinabove with reference to Figs. 2-8.

[20158] VGAM1443 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper mottle virus.

VGAM1443 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20159] VGAM1443 gene, herein designated VGAM GENE, encodes a VGAM1443 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1443 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1443 precursor RNA is designated SEQ ID:1429, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1429 is located at position 4259 relative to the genome of Pepper mottle virus.

[20160] VGAM1443 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1443 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[20161] An enzyme complex designated DICER COMPLEX, dices the VGAM1443 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1443 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1443 RNA is designated SEQ ID:4154, and is provided hereinbelow with reference to the sequence listing part.

[20162] VGAM1443 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1443 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1443 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20163] VGAM1443 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1443 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1443 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1443 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1443 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20164] The complementary binding of VGAM1443 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1443 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1443 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1443 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20165] It is appreciated that VGAM1443 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1443 host target genes. The mRNA of each one of this plurality of VGAM1443 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1443 RNA, herein designated VGAM RNA, and which when bound by VGAM1443 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1443 host target proteins.

[20166] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1443 gene, herein designated VGAM GENE, on one or more VGAM1443 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20167] It is yet further appreciated that a function of VGAM1443 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1443 include diagnosis, prevention and treatment of viral infection by Pepper mottle virus. Specific functions, and accordingly utilities, of VGAM1443 correlate with, and may be deduced from, the identity of the host target genes which VGAM1443 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20168] Nucleotide sequences of the VGAM1443 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1443 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1443 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1443 are further described hereinbelow with reference to Table 1.

[20169] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1443 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20170] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1444 (VGAM1444) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20171] VGAM1444 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1444 was detected is described hereinabove with reference to Figs. 2-8.

[20172] VGAM1444 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Pepper mottle virus. VGAM1444 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20173] VGAM1444 gene, herein designated VGAM GENE, encodes a VGAM1444 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1444 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1444 precursor RNA is designated SEQ ID:1430, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1430 is located at position 4768 relative to the genome of Pepper mottle virus.

[20174] VGAM1444 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1444 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20175] An enzyme complex designated DICER COMPLEX, dices the VGAM1444 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1444 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1444 RNA is designated SEQ ID:4155, and is provided hereinbelow with reference to the sequence listing part.

[20176] VGAM1444 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1444 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1444 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20177] VGAM1444 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1444 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1444 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1444 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1444 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20178] The complementary binding of VGAM1444 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1444 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1444 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1444 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20179] It is appreciated that VGAM1444 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1444 host target genes. The mRNA of each one of this plurality of VGAM1444 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1444 RNA, herein designated VGAM RNA, and which when bound by VGAM1444 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1444 host target proteins.

[20180] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1444 gene, herein designated VGAM GENE, on one or more VGAM1444 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20181] It is yet further appreciated that a function of VGAM1444 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1444 include diagnosis, prevention and treatment of viral infection by Pepper mottle virus. Specific functions, and accordingly utilities, of VGAM1444 correlate with, and may be deduced from, the identity of the host target genes which VGAM1444 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20182] Nucleotide sequences of the VGAM1444 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1444 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1444 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1444 are further described hereinbelow with reference to Table 1.

[20183] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1444 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20184] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1445 (VGAM1445) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20185] VGAM1445 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1445 was detected is described hereinabove with reference to Figs. 2-8.

[20186] VGAM1445 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper mottle virus.

VGAM1445 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20187] VGAM1445 gene, herein designated VGAM GENE, encodes a VGAM1445 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1445 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1445 precursor RNA is designated SEQ ID:1431, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1431 is located at position 5583 relative to the genome of Pepper mottle virus.

[20188] VGAM1445 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1445 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20189] An enzyme complex designated DICER COMPLEX, dices the VGAM1445 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1445 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1445 RNA is designated SEQ ID:4156, and is provided hereinbelow with reference to the sequence listing part.

[20190] VGAM1445 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1445 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1445 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[20191] VGAM1445 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1445 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1445 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1445 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1445 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20192] The complementary binding of VGAM1445 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1445 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1445 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1445 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20193] It is appreciated that VGAM1445 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1445 host target genes. The mRNA of each one of this plurality of VGAM1445 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1445 RNA, herein designated VGAM RNA, and which when bound by VGAM1445 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1445 host target proteins.

[20194] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1445 gene, herein designated VGAM GENE, on one

or more VGAM1445 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20195] It is yet further appreciated that a function of VGAM1445 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1445 include diagnosis, prevention and treatment of viral infection by Pepper mottle virus. Specific functions, and accordingly utilities, of VGAM1445 correlate with, and may be deduced from, the identity of the host target genes which VGAM1445 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20196] Nucleotide sequences of the VGAM1445 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1445 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1445 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1445 are further described hereinbelow with reference to Table 1.

[20197] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1445 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20198] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1446 (VGAM1446) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20199] VGAM1446 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1446 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[20200] VGAM1446 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper mottle virus.

VGAM1446 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20201] VGAM1446 gene, herein designated VGAM GENE, encodes a VGAM1446 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1446 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1446 precursor RNA is designated SEQ ID:1432, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1432 is located at position 3107 relative to the genome of Pepper mottle virus.

[20202] VGAM1446 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1446 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20203] An enzyme complex designated DICER COMPLEX, dices the VGAM1446 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1446 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1446 RNA is designated SEQ ID:4157, and is provided hereinbelow with reference to the sequence listing part.

[20204] VGAM1446 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1446 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1446 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20205] VGAM1446 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1446 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1446 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1446 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1446 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[20206] The complementary binding of VGAM1446 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1446 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1446 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1446 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20207] It is appreciated that VGAM1446 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1446 host target genes. The mRNA of each one of this plurality of VGAM1446 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1446 RNA, herein designated VGAM RNA, and which when bound by VGAM1446 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1446 host target proteins.

[20208] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1446 gene, herein designated VGAM GENE, on one or more VGAM1446 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20209] It is yet further appreciated that a function of VGAM1446 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1446 include diagnosis, prevention and treatment of viral infection by Pepper mottle virus. Specific functions, and accordingly utilities, of VGAM1446 correlate with, and may be deduced from, the identity of the host target genes which VGAM1446 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[20210] Nucleotide sequences of the VGAM1446 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1446 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1446 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1446 are further described hereinbelow with reference to Table 1.

[20211] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1446 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20212] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1447 (VGAM1447) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20213] VGAM1447 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1447 was detected is described hereinabove with reference to Figs. 2–8.

[20214] VGAM1447 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper mottle virus.

VGAM1447 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20215] VGAM1447 gene, herein designated VGAM GENE, encodes a VGAM1447 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1447 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1447 precursor RNA is designated SEQ ID:1433, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1433 is located at position 1681 relative to the genome of Pepper mottle virus.

[20216] VGAM1447 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1447 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20217] An enzyme complex designated DICER COMPLEX, dices the VGAM1447 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1447 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1447 RNA is designated SEQ ID:4158, and is provided hereinbelow with reference to the sequence listing part.

[20218] VGAM1447 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1447 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1447 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20219] VGAM1447 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1447 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1447 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1447 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20220] The complementary binding of VGAM1447 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1447 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1447 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1447 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20221] It is appreciated that VGAM1447 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1447 host target genes. The mRNA of each one of this plurality of VGAM1447 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1447 RNA, herein designated VGAM RNA, and which when bound by VGAM1447 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1447 host target proteins.

[20222] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1447 gene, herein designated VGAM GENE, on one or more VGAM1447 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20223] It is yet further appreciated that a function of VGAM1447 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of viral infection by Pepper mottle virus. Specific functions, and accordingly utilities, of VGAM1447 correlate with, and may be deduced from, the identity of the host target genes which VGAM1447 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[20224] Nucleotide sequences of the VGAM1447 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1447 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1447 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1447 are further described hereinbelow with reference to Table 1.

[20225] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1447 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20226] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1448 (VGAM1448) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20227] VGAM1448 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1448 was detected is described hereinabove with reference to Figs. 2–8.

[20228] VGAM1448 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper mottle virus. VGAM1448 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20229] VGAM1448 gene, herein designated VGAM GENE, encodes a VGAM1448 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1448 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1448 precursor RNA is designated SEQ ID:1434, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1434 is located at position 8114 relative to the genome of Pepper mottle virus.

[20230] VGAM1448 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1448 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20231] An enzyme complex designated DICER COMPLEX, dices the VGAM1448 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1448 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1448 RNA is designated SEQ ID:4159, and is provided hereinbelow with reference to the sequence listing part.

[20232] VGAM1448 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1448 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1448 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20233] VGAM1448 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1448 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1448 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1448 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1448 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20234] The complementary binding of VGAM1448 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1448 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1448 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1448 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20235] It is appreciated that VGAM1448 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1448 host target genes. The mRNA of each one of this plurality of VGAM1448 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1448 RNA, herein designated VGAM RNA, and which when bound by VGAM1448 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1448 host target proteins.

[20236] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1448 gene, herein designated VGAM GENE, on one or more VGAM1448 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20237] It is yet further appreciated that a function of VGAM1448 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1448 include diagnosis, prevention and treatment of viral infection by Pepper mottle virus. Specific functions, and accordingly utilities, of VGAM1448 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1448 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20238] Nucleotide sequences of the VGAM1448 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1448 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1448 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1448 are further described hereinbelow with reference to Table 1.

[20239] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1448 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20240] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1449 (VGAM1449) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20241] VGAM1449 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1449 was detected is described hereinabove with reference to Figs. 2–8.

[20242] VGAM1449 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM1449 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20243] VGAM1449 gene, herein designated VGAM GENE, encodes a VGAM1449 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1449 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1449 precursor RNA is designated SEQ ID:1435, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1435 is located at position 38531 relative to the genome of Equine herpesvirus 2.

[20244] VGAM1449 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1449 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20245] An enzyme complex designated DICER COMPLEX, dices the VGAM1449 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1449 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM1449 RNA is designated SEQ ID:4160, and is provided hereinbelow with reference to the sequence listing part.

[20246] VGAM1449 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1449 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1449 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20247] VGAM1449 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1449 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1449 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1449 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1449 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20248] The complementary binding of VGAM1449 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1449 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1449 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1449 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20249] It is appreciated that VGAM1449 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1449 host target genes. The mRNA of each one of this plurality of VGAM1449 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1449 RNA, herein designated VGAM RNA, and which when bound by VGAM1449 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1449 host target proteins.

[20250] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1449 gene, herein designated VGAM GENE, on one or more VGAM1449 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20251] It is yet further appreciated that a function of VGAM1449 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1449 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1449

correlate with, and may be deduced from, the identity of the host target genes which VGAM1449 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20252] Nucleotide sequences of the VGAM1449 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1449 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1449 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1449 are further described hereinbelow with reference to Table 1.

[20253] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1449 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20254] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1450 (VGAM1450) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[20255] VGAM1450 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1450 was detected is described hereinabove with reference to Figs. 2–8.

[20256] VGAM1450 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM1450 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20257] VGAM1450 gene, herein designated VGAM GENE, encodes a VGAM1450 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1450 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1450 precursor RNA is designated SEQ ID:1436, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1436 is located at position 40972 relative to the genome of Equine herpesvirus 2.

[20258] VGAM1450 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1450 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20259] An enzyme complex designated DICER COMPLEX, dices the VGAM1450 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1450 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1450 RNA is designated SEQ ID:4161, and is provided hereinbelow with reference to the sequence listing part.

[20260] VGAM1450 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1450 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1450 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20261] VGAM1450 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1450 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1450 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1450 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1450 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20262] The complementary binding of VGAM1450 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1450 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1450 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1450 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20263] It is appreciated that VGAM1450 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1450 host target genes. The mRNA of each one of this plurality of VGAM1450 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1450 RNA, herein designated VGAM RNA, and which when bound by VGAM1450 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1450 host target proteins.

[20264] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1450 gene, herein designated VGAM GENE, on one or more VGAM1450 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20265] It is yet further appreciated that a function of VGAM1450 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1450 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Spe-

cific functions, and accordingly utilities, of VGAM1450 correlate with, and may be deduced from, the identity of the host target genes which VGAM1450 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20266] Nucleotide sequences of the VGAM1450 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1450 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1450 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1450 are further described hereinbelow with reference to Table 1.

[20267] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1450 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20268] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1451 (VGAM1451) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[20269] VGAM1451 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1451 was detected is described hereinabove with reference to Figs. 2–8.

[20270] VGAM1451 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM1451 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20271] VGAM1451 gene, herein designated VGAM GENE, encodes a VGAM1451 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1451 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1451 precursor RNA is designated SEQ ID:1437, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1437 is located at position 40488 relative to the genome of Equine herpesvirus 2.

[20272] VGAM1451 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1451 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20273] An enzyme complex designated DICER COMPLEX, dices the VGAM1451 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1451 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM1451 RNA is designated SEQ ID:4162, and is provided hereinbelow with reference to the sequence listing part.

[20274] VGAM1451 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1451 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1451 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20275] VGAM1451 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1451 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1451 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1451 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1451 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20276] The complementary binding of VGAM1451 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1451 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1451 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1451 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20277] It is appreciated that VGAM1451 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1451 host target genes. The mRNA of each one of this plurality of VGAM1451 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1451 RNA, herein designated VGAM RNA, and which when bound by VGAM1451 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1451 host target proteins.

[20278] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1451 gene, herein designated VGAM GENE, on one or more VGAM1451 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20279] It is yet further appreciated that a function of VGAM1451 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1451 include diagnosis, prevention and

treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1451 correlate with, and may be deduced from, the identity of the host target genes which VGAM1451 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20280] Nucleotide sequences of the VGAM1451 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1451 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1451 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1451 are further described hereinbelow with reference to Table 1.

[20281] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1451 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20282] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1452 (VGAM1452) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20283] VGAM1452 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1452 was detected is described hereinabove with reference to Figs. 2–8.

[20284] VGAM1452 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM1452 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20285] VGAM1452 gene, herein designated VGAM GENE, encodes a VGAM1452 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1452 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1452 precursor RNA is designated SEQ ID:1438, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1438 is located at position 42439 relative to the genome of Equine herpesvirus 2.

[20286] VGAM1452 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1452 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20287] An enzyme complex designated DICER COMPLEX, dices the VGAM1452 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1452 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM1452 RNA is designated SEQ ID:4163, and is provided hereinbelow with reference to the sequence listing part.

[20288] VGAM1452 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1452 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1452 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20289] VGAM1452 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1452 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1452 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1452 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1452 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20290] The complementary binding of VGAM1452 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1452 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1452 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1452 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20291] It is appreciated that VGAM1452 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1452 host target genes. The mRNA of each one of this plurality of VGAM1452 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1452 RNA, herein designated VGAM

RNA, and which when bound by VGAM1452 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1452 host target proteins.

[20292] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1452 gene, herein designated VGAM GENE, on one or more VGAM1452 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20293] It is yet further appreciated that a function of VGAM1452 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1452 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1452 correlate with, and may be deduced from, the identity of the host target genes which VGAM1452 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20294] Nucleotide sequences of the VGAM1452 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1452 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1452 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1452 are further described hereinbelow with reference to Table 1.

[20295] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1452 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20296] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1453 (VGAM1453) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20297] VGAM1453 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1453 was detected is described hereinabove with reference to Figs. 2-8.

[20298] VGAM1453 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM1453 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20299] VGAM1453 gene, herein designated VGAM GENE, encodes a VGAM1453 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1453 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1453 precursor RNA is designated SEQ ID:1439, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1439 is located at position

41504 relative to the genome of Equine herpesvirus 2.

[20300] VGAM1453 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1453 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20301] An enzyme complex designated DICER COMPLEX, dices the VGAM1453 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1453 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1453 RNA is designated SEQ ID:4164, and is provided hereinbelow with reference to the sequence listing part.

[20302] VGAM1453 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1453 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1453 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20303] VGAM1453 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1453 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1453 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1453 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1453 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20304] The complementary binding of VGAM1453 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1453 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1453 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1453 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20305] It is appreciated that VGAM1453 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1453 host target genes. The mRNA of each one of this plurality of VGAM1453 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1453 RNA, herein designated VGAM RNA, and which when bound by VGAM1453 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1453 host target proteins.

[20306] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1453 gene, herein designated VGAM GENE, on one or more VGAM1453 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20307] It is yet further appreciated that a function of VGAM1453 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1453 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1453 correlate with, and may be deduced from, the identity of the host target genes which VGAM1453 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20308] Nucleotide sequences of the VGAM1453 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM1453 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1453 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1453 are further described hereinbelow with reference to Table 1.

[20309] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1453 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20310] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1454 (VGAM1454) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20311] VGAM1454 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1454 was detected is described hereinabove with reference to Figs. 2–8.

[20312] VGAM1454 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM1454 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20313] VGAM1454 gene, herein designated VGAM GENE, encodes a VGAM1454 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1454 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1454 precursor RNA is designated SEQ ID:1440, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:1440 is located at position 41662 relative to the genome of Equine herpesvirus 2.

[20314] VGAM1454 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1454 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20315] An enzyme complex designated DICER COMPLEX, dices the VGAM1454 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1454 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM1454 RNA is designated SEQ ID:4165, and is provided hereinbelow with reference to the sequence

listing part.

[20316] VGAM1454 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1454 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1454 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20317] VGAM1454 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1454 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1454 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1454 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1454 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20318] The complementary binding of VGAM1454 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1454 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1454 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1454 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20319] It is appreciated that VGAM1454 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1454 host target genes. The mRNA of each one of this plurality of VGAM1454 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1454 RNA, herein designated VGAM RNA, and which when bound by VGAM1454 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1454 host target proteins.

[20320] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1454 gene, herein designated VGAM GENE, on one or more VGAM1454 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20321] It is yet further appreciated that a function of VGAM1454

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1454 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1454 correlate with, and may be deduced from, the identity of the host target genes which VGAM1454 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20322] Nucleotide sequences of the VGAM1454 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1454 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1454 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1454 are further described hereinbelow with reference to Table 1.

[20323] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1454 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20324] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1455 (VGAM1455) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20325] VGAM1455 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1455 was detected is described hereinabove with reference to Figs. 2–8.

[20326] VGAM1455 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM1455 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20327] VGAM1455 gene, herein designated VGAM GENE, encodes a VGAM1455 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1455 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1455 precursor RNA is designated SEQ ID:1441, and is provided here–

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1441 is located at position 42997 relative to the genome of Equine herpesvirus 2.

[20328] VGAM1455 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1455 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20329] An enzyme complex designated DICER COMPLEX, dices the VGAM1455 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1455 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide sequence of VGAM1455 RNA is designated SEQ ID:4166, and

is provided hereinbelow with reference to the sequence listing part.

[20330] VGAM1455 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1455 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1455 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20331] VGAM1455 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1455 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1455 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1455 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1455 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20332] The complementary binding of VGAM1455 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1455 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1455 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1455 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20333] It is appreciated that VGAM1455 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1455 host target genes. The mRNA of each one of this plurality of VGAM1455 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1455 RNA, herein designated VGAM RNA, and which when bound by VGAM1455 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1455 host target proteins.

[20334] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1455 gene, herein designated VGAM GENE, on one or more VGAM1455 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20335] It is yet further appreciated that a function of VGAM1455 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1455 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1455 correlate with, and may be deduced from, the identity of the host target genes which VGAM1455 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20336] Nucleotide sequences of the VGAM1455 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM1455 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1455 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1455 are further described hereinbelow with reference to Table 1.

[20337] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1455 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20338] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1456 (VGAM1456) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20339] VGAM1456 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1456 was detected is described hereinabove with reference to Figs. 2–8.

[20340] VGAM1456 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM1456 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20341] VGAM1456 gene, herein designated VGAM GENE, encodes a VGAM1456 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1456 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1456 precu-

sor RNA is designated SEQ ID:1442, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1442 is located at position 39288 relative to the genome of Equine herpesvirus 2.

[20342] VGAM1456 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1456 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20343] An enzyme complex designated DICER COMPLEX, dices the VGAM1456 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1456 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide se-

quence of VGAM1456 RNA is designated SEQ ID:4167, and is provided hereinbelow with reference to the sequence listing part.

[20344] VGAM1456 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1456 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1456 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20345] VGAM1456 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1456 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1456 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1456 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1456 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20346] The complementary binding of VGAM1456 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1456 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1456 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1456 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20347] It is appreciated that VGAM1456 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1456 host target genes. The mRNA of

each one of this plurality of VGAM1456 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1456 RNA, herein designated VGAM RNA, and which when bound by VGAM1456 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1456 host target proteins.

[20348] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1456 gene, herein designated VGAM GENE, on one or more VGAM1456 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[20349] It is yet further appreciated that a function of VGAM1456 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1456 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1456 correlate with, and may be deduced from, the identity of the host target genes which VGAM1456 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20350] Nucleotide sequences of the VGAM1456 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1456 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1456 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1456 are further described hereinbelow with reference to Table 1.

[20351] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1456 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[20352] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1457 (VGAM1457) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20353] VGAM1457 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1457 was detected is described hereinabove with reference to Figs. 2–8.

[20354] VGAM1457 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM1457 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20355] VGAM1457 gene, herein designated VGAM GENE, encodes a VGAM1457 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1457 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1457 precursor RNA is designated SEQ ID:1443, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1443 is located at position 43126 relative to the genome of Equine herpesvirus 2.

[20356] VGAM1457 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1457 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20357] An enzyme complex designated DICER COMPLEX, dices the VGAM1457 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1457 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1457 RNA is designated SEQ ID:4168, and is provided hereinbelow with reference to the sequence listing part.

[20358] VGAM1457 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1457 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1457 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20359] VGAM1457 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1457 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1457 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1457 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1457 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20360] The complementary binding of VGAM1457 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1457 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1457 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1457 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20361] It is appreciated that VGAM1457 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1457 host target genes. The mRNA of each one of this plurality of VGAM1457 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1457 RNA, herein designated VGAM RNA, and which when bound by VGAM1457 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1457 host target proteins.

[20362] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1457 gene, herein designated VGAM GENE, on one or more VGAM1457 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [20363] It is yet further appreciated that a function of VGAM1457 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1457 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1457 correlate with, and may be deduced from, the identity of the host target genes which VGAM1457 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [20364] Nucleotide sequences of the VGAM1457 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1457 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1457 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1457 are further described hereinbelow with reference to Table 1.
- [20365] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1457 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20366] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1458 (VGAM1458) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20367] VGAM1458 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1458 was detected is described hereinabove with reference to Figs. 2-8.

[20368] VGAM1458 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM1458 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20369] VGAM1458 gene, herein designated VGAM GENE, encodes a VGAM1458 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1458 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1458 precursor RNA is designated SEQ ID:1444, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1444 is located at position 39736 relative to the genome of Equine herpesvirus 2.

[20370] VGAM1458 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1458 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20371] An enzyme complex designated DICER COMPLEX, dices the VGAM1458 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1458 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1458 RNA is designated SEQ ID:4169, and is provided hereinbelow with reference to the sequence listing part.

[20372] VGAM1458 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1458 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1458 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20373] VGAM1458 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1458 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1458 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1458 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1458 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20374] The complementary binding of VGAM1458 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1458 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1458 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1458 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20375] It is appreciated that VGAM1458 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1458 host target genes. The mRNA of each one of this plurality of VGAM1458 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1458 RNA, herein designated VGAM RNA, and which when bound by VGAM1458 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1458 host target proteins.

[20376] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1458 gene, herein designated VGAM GENE, on one or more VGAM1458 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20377] It is yet further appreciated that a function of VGAM1458 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1458 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1458 correlate with, and may be deduced from, the identity of the host target genes which VGAM1458 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20378] Nucleotide sequences of the VGAM1458 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1458 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1458 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1458 are further described hereinbelow with reference to Table 1.

[20379] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1458 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20380] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1459 (VGAM1459) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20381] VGAM1459 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1459 was detected is described hereinabove with reference to Figs. 2–8.

[20382] VGAM1459 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM1459 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20383] VGAM1459 gene, herein designated VGAM GENE, encodes a VGAM1459 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1459 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1459 precursor RNA is designated SEQ ID:1445, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1445 is located at position 39156 relative to the genome of Equine herpesvirus 2.

[20384] VGAM1459 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1459 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20385] An enzyme complex designated DICER COMPLEX, dices the VGAM1459 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1459 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1459 RNA is designated SEQ ID:4170, and is provided hereinbelow with reference to the sequence listing part.

[20386] VGAM1459 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1459 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1459 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20387] VGAM1459 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1459 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1459 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1459 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1459 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20388] The complementary binding of VGAM1459 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1459 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1459 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1459 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20389] It is appreciated that VGAM1459 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1459 host target genes. The mRNA of each one of this plurality of VGAM1459 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1459 RNA, herein designated VGAM RNA, and which when bound by VGAM1459 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1459 host target proteins.

[20390] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1459 gene, herein designated VGAM GENE, on one or more VGAM1459 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20391] It is yet further appreciated that a function of VGAM1459 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1459 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1459 correlate with, and may be deduced from, the identity of the host target genes which VGAM1459 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20392] Nucleotide sequences of the VGAM1459 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1459 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1459 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1459 are further described hereinbelow with reference to Table 1.

[20393] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1459 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20394] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1460 (VGAM1460) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20395] VGAM1460 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1460 was detected is described hereinabove with reference to Figs. 2-8.

[20396] VGAM1460 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM1460 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20397] VGAM1460 gene, herein designated VGAM GENE, encodes a VGAM1460 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1460 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1460 precursor RNA is designated SEQ ID:1446, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1446 is located at position 39460 relative to the genome of Equine herpesvirus 2.

[20398] VGAM1460 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1460 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20399] An enzyme complex designated DICER COMPLEX, dices the VGAM1460 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1460 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM1460 RNA is designated SEQ ID:4171, and is provided hereinbelow with reference to the sequence listing part.

[20400] VGAM1460 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1460 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1460 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20401] VGAM1460 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1460 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1460 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1460 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1460 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20402] The complementary binding of VGAM1460 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1460 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1460 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1460 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20403] It is appreciated that VGAM1460 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1460 host target genes. The mRNA of each one of this plurality of VGAM1460 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1460 RNA, herein designated VGAM RNA, and which when bound by VGAM1460 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1460 host target proteins.

[20404] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1460 gene, herein designated VGAM GENE, on one or more VGAM1460 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20405] It is yet further appreciated that a function of VGAM1460 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1460 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1460 correlate with, and may be deduced from, the identity of the host target genes which VGAM1460 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20406] Nucleotide sequences of the VGAM1460 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1460 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1460 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1460 are further described hereinbelow with reference to Table 1.

[20407] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1460 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20408] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1461 (VGAM1461) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20409] VGAM1461 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1461 was detected is described hereinabove with reference to Figs. 2-8.

[20410] VGAM1461 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2.

VGAM1461 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20411] VGAM1461 gene, herein designated VGAM GENE, encodes a VGAM1461 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1461 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1461 precursor RNA is designated SEQ ID:1447, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1447 is located at position 44627 relative to the genome of Equine herpesvirus 2.

[20412] VGAM1461 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1461 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[20413] An enzyme complex designated DICER COMPLEX, dices the VGAM1461 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1461 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1461 RNA is designated SEQ ID:4172, and is provided hereinbelow with reference to the sequence listing part.

[20414] VGAM1461 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1461 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1461 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20415] VGAM1461 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1461 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1461 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1461 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1461 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20416] The complementary binding of VGAM1461 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1461 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1461 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1461 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20417] It is appreciated that VGAM1461 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1461 host target genes. The mRNA of each one of this plurality of VGAM1461 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1461 RNA, herein designated VGAM RNA, and which when bound by VGAM1461 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1461 host target proteins.

[20418] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1461 gene, herein designated VGAM GENE, on one or more VGAM1461 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20419] It is yet further appreciated that a function of VGAM1461 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1461 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1461 correlate with, and may be deduced from, the identity of the host target genes which VGAM1461 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20420] Nucleotide sequences of the VGAM1461 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1461 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1461 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1461 are further described hereinbelow with reference to Table 1.

[20421] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1461 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20422] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1462 (VGAM1462) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20423] VGAM1462 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1462 was detected is described hereinabove with reference to Figs. 2-8.

[20424] VGAM1462 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Equine herpesvirus 2. VGAM1462 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20425] VGAM1462 gene, herein designated VGAM GENE, encodes a VGAM1462 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1462 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1462 precursor RNA is designated SEQ ID:1448, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1448 is located at position 40327 relative to the genome of Equine herpesvirus 2.

[20426] VGAM1462 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1462 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20427] An enzyme complex designated DICER COMPLEX, dices the VGAM1462 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1462 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1462 RNA is designated SEQ ID:4173, and is provided hereinbelow with reference to the sequence listing part.

[20428] VGAM1462 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1462 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1462 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20429] VGAM1462 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1462 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1462 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1462 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1462 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20430] The complementary binding of VGAM1462 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1462 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1462 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1462 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20431] It is appreciated that VGAM1462 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1462 host target genes. The mRNA of each one of this plurality of VGAM1462 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1462 RNA, herein designated VGAM RNA, and which when bound by VGAM1462 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1462 host target proteins.

[20432] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1462 gene, herein designated VGAM GENE, on one or more VGAM1462 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20433] It is yet further appreciated that a function of VGAM1462 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1462 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1462 correlate with, and may be deduced from, the identity of the host target genes which VGAM1462 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20434] Nucleotide sequences of the VGAM1462 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1462 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1462 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1462 are further described hereinbelow with reference to Table 1.

[20435] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1462 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20436] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1463 (VGAM1463) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20437] VGAM1463 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1463 was detected is described hereinabove with reference to Figs. 2-8.

[20438] VGAM1463 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM1463 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20439] VGAM1463 gene, herein designated VGAM GENE, encodes a VGAM1463 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1463 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1463 precursor RNA is designated SEQ ID:1449, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1449 is located at position 38131 relative to the genome of Equine herpesvirus 2.

[20440] VGAM1463 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1463 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20441] An enzyme complex designated DICER COMPLEX, dices the VGAM1463 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1463 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1463 RNA is designated SEQ ID:4174, and is provided hereinbelow with reference to the sequence listing part.

[20442] VGAM1463 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1463 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1463 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[20443] VGAM1463 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1463 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1463 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1463 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1463 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20444] The complementary binding of VGAM1463 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1463 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1463 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1463 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20445] It is appreciated that VGAM1463 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1463 host target genes. The mRNA of each one of this plurality of VGAM1463 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1463 RNA, herein designated VGAM RNA, and which when bound by VGAM1463 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1463 host target proteins.

[20446] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1463 gene, herein designated VGAM GENE, on one

or more VGAM1463 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20447] It is yet further appreciated that a function of VGAM1463 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1463 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1463 correlate with, and may be deduced from, the identity of the host target genes which VGAM1463 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20448] Nucleotide sequences of the VGAM1463 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1463 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1463 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1463 are further described hereinbelow with reference to Table 1.

[20449] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1463 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20450] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1464 (VGAM1464) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20451] VGAM1464 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1464 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[20452] VGAM1464 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM1464 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20453] VGAM1464 gene, herein designated VGAM GENE, encodes a VGAM1464 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1464 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1464 precursor RNA is designated SEQ ID:1450, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1450 is located at position 42592 relative to the genome of Equine herpesvirus 2.

[20454] VGAM1464 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1464 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20455] An enzyme complex designated DICER COMPLEX, dices the VGAM1464 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1464 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM1464 RNA is designated SEQ ID:4175, and is provided hereinbelow with reference to the sequence listing part.

[20456] VGAM1464 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1464 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1464 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20457] VGAM1464 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1464 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1464 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1464 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1464 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[20458] The complementary binding of VGAM1464 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1464 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1464 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1464 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20459] It is appreciated that VGAM1464 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1464 host target genes. The mRNA of each one of this plurality of VGAM1464 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1464 RNA, herein designated VGAM RNA, and which when bound by VGAM1464 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1464 host target proteins.

[20460] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1464 gene, herein designated VGAM GENE, on one or more VGAM1464 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20461] It is yet further appreciated that a function of VGAM1464 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1464 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1464 correlate with, and may be deduced from, the identity of the host target genes which VGAM1464 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[20462] Nucleotide sequences of the VGAM1464 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1464 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1464 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1464 are further described hereinbelow with reference to Table 1.

[20463] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1464 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20464] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1465 (VGAM1465) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20465] VGAM1465 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1465 was detected is described hereinabove with reference to Figs. 2–8.

[20466] VGAM1465 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM1465 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20467] VGAM1465 gene, herein designated VGAM GENE, encodes a VGAM1465 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1465 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1465 precursor RNA is designated SEQ ID:1451, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1451 is located at position 40669 relative to the genome of Equine herpesvirus 2.

[20468] VGAM1465 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1465 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20469] An enzyme complex designated DICER COMPLEX, dices the VGAM1465 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1465 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1465 RNA is designated SEQ ID:4176, and is provided hereinbelow with reference to the sequence listing part.

[20470] VGAM1465 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1465 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1465 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20471] VGAM1465 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1465 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1465 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1465 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1465 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20472] The complementary binding of VGAM1465 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1465 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1465 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1465 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20473] It is appreciated that VGAM1465 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1465 host target genes. The mRNA of each one of this plurality of VGAM1465 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1465 RNA, herein designated VGAM RNA, and which when bound by VGAM1465 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1465 host target proteins.

[20474] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1465 gene, herein designated VGAM GENE, on one or more VGAM1465 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20475] It is yet further appreciated that a function of VGAM1465 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1465 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1465 correlate with, and may be deduced from, the identity of the host target genes which VGAM1465 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[20476] Nucleotide sequences of the VGAM1465 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1465 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1465 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1465 are further described hereinbelow with reference to Table 1.

[20477] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1465 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20478] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1466 (VGAM1466) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20479] VGAM1466 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1466 was detected is described hereinabove with reference to Figs. 2–8.

[20480] VGAM1466 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM1466 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20481] VGAM1466 gene, herein designated VGAM GENE, encodes a VGAM1466 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1466 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1466 precursor RNA is designated SEQ ID:1452, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1452 is located at position 39035 relative to the genome of Equine herpesvirus 2.

[20482] VGAM1466 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1466 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20483] An enzyme complex designated DICER COMPLEX, dices the VGAM1466 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1466 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1466 RNA is designated SEQ ID:4177, and is provided hereinbelow with reference to the sequence listing part.

[20484] VGAM1466 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1466 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1466 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20485] VGAM1466 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1466 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1466 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1466 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20486] The complementary binding of VGAM1466 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1466 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1466 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1466 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20487] It is appreciated that VGAM1466 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1466 host target genes. The mRNA of each one of this plurality of VGAM1466 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1466 RNA, herein designated VGAM RNA, and which when bound by VGAM1466 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1466 host target proteins.

[20488] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1466 gene, herein designated VGAM GENE, on one or more VGAM1466 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20489] It is yet further appreciated that a function of VGAM1466 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1466 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1466 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20490] Nucleotide sequences of the VGAM1466 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1466 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1466 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1466 are further described hereinbelow with reference to Table 1.

[20491] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1466 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20492] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1467 (VGAM1467) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20493] VGAM1467 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1467 was detected is described hereinabove with reference to Figs. 2–8.

[20494] VGAM1467 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM1467 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20495] VGAM1467 gene, herein designated VGAM GENE, encodes a VGAM1467 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1467 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1467 precursor RNA is designated SEQ ID:1453, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1453 is located at position 40183 relative to the genome of Equine herpesvirus 2.

[20496] VGAM1467 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1467 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20497] An enzyme complex designated DICER COMPLEX, dices the VGAM1467 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1467 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1467 RNA is designated SEQ ID:4178, and is provided hereinbelow with reference to the sequence listing part.

[20498] VGAM1467 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1467 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1467 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20499] VGAM1467 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1467 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1467 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1467 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1467 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20500] The complementary binding of VGAM1467 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1467 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1467 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1467 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20501] It is appreciated that VGAM1467 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1467 host target genes. The mRNA of each one of this plurality of VGAM1467 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1467 RNA, herein designated VGAM RNA, and which when bound by VGAM1467 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1467 host target proteins.

[20502] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1467 gene, herein designated VGAM GENE, on one or more VGAM1467 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20503] It is yet further appreciated that a function of VGAM1467 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1467 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1467

correlate with, and may be deduced from, the identity of the host target genes which VGAM1467 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20504] Nucleotide sequences of the VGAM1467 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1467 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1467 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1467 are further described hereinbelow with reference to Table 1.

[20505] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1467 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20506] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1468 (VGAM1468) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[20507] VGAM1468 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1468 was detected is described hereinabove with reference to Figs. 2–8.

[20508] VGAM1468 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious flacherie virus. VGAM1468 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20509] VGAM1468 gene, herein designated VGAM GENE, encodes a VGAM1468 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1468 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1468 precursor RNA is designated SEQ ID:1454, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1454 is located at position 4200 relative to the genome of Infectious flacherie virus.

[20510] VGAM1468 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1468 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20511] An enzyme complex designated DICER COMPLEX, dices the VGAM1468 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1468 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1468 RNA is designated SEQ ID:4179, and is provided hereinbelow with reference to the sequence listing part.

[20512] VGAM1468 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1468 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1468 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20513] VGAM1468 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1468 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1468 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1468 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1468 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20514] The complementary binding of VGAM1468 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1468 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1468 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1468 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20515] It is appreciated that VGAM1468 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1468 host target genes. The mRNA of each one of this plurality of VGAM1468 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1468 RNA, herein designated VGAM RNA, and which when bound by VGAM1468 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1468 host target proteins.

[20516] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1468 gene, herein designated VGAM GENE, on one or more VGAM1468 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20517] It is yet further appreciated that a function of VGAM1468 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1468 include diagnosis, prevention and treatment of viral infection by Infectious flacherie virus.

Specific functions, and accordingly utilities, of VGAM1468 correlate with, and may be deduced from, the identity of the host target genes which VGAM1468 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20518] Nucleotide sequences of the VGAM1468 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1468 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1468 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1468 are further described hereinbelow with reference to Table 1.

[20519] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1468 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20520] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1469 (VGAM1469) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[20521] VGAM1469 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1469 was detected is described hereinabove with reference to Figs. 2–8.

[20522] VGAM1469 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious flacherie virus. VGAM1469 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20523] VGAM1469 gene, herein designated VGAM GENE, encodes a VGAM1469 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1469 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1469 precursor RNA is designated SEQ ID:1455, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1455 is located at position 916 relative to the genome of Infectious flacherie virus.

[20524] VGAM1469 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM1469 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20525] An enzyme complex designated DICER COMPLEX, dices the VGAM1469 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1469 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM1469 RNA is designated SEQ ID:4180, and is provided hereinbelow with reference to the sequence listing part.

[20526] VGAM1469 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1469 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1469 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20527] VGAM1469 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1469 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1469 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1469 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1469 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20528] The complementary binding of VGAM1469 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1469 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1469 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1469 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20529] It is appreciated that VGAM1469 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1469 host target genes. The mRNA of each one of this plurality of VGAM1469 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1469 RNA, herein designated VGAM RNA, and which when bound by VGAM1469 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1469 host target proteins.

[20530] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1469 gene, herein designated VGAM GENE, on one or more VGAM1469 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20531] It is yet further appreciated that a function of VGAM1469 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1469 include diagnosis, prevention and

treatment of viral infection by Infectious flacherie virus. Specific functions, and accordingly utilities, of VGAM1469 correlate with, and may be deduced from, the identity of the host target genes which VGAM1469 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20532] Nucleotide sequences of the VGAM1469 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1469 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1469 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1469 are further described hereinbelow with reference to Table 1.

[20533] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1469 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20534] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1470 (VGAM1470) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20535] VGAM1470 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1470 was detected is described hereinabove with reference to Figs. 2–8.

[20536] VGAM1470 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cocksfoot streak virus (CSV). VGAM1470 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20537] VGAM1470 gene, herein designated VGAM GENE, encodes a VGAM1470 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1470 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1470 precursor RNA is designated SEQ ID:1456, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1456 is located at position 5947 relative to the genome of Cocksfoot streak virus (CSV).

[20538] VGAM1470 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1470 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20539] An enzyme complex designated DICER COMPLEX, dices the VGAM1470 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1470 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1470 RNA is designated SEQ ID:4181, and is provided hereinbelow with reference to the sequence listing part.

[20540] VGAM1470 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1470 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1470 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20541] VGAM1470 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1470 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1470 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1470 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM1470 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20542] The complementary binding of VGAM1470 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1470 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1470 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1470 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20543] It is appreciated that VGAM1470 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1470 host target genes. The mRNA of each one of this plurality of VGAM1470 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1470 RNA, herein designated VGAM

RNA, and which when bound by VGAM1470 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1470 host target proteins.

[20544] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1470 gene, herein designated VGAM GENE, on one or more VGAM1470 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20545] It is yet further appreciated that a function of VGAM1470 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1470 include diagnosis, prevention and treatment of viral infection by Cocksfoot streak virus (CSV). Specific functions, and accordingly utilities, of VGAM1470 correlate with, and may be deduced from, the identity of the host target genes which VGAM1470 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20546] Nucleotide sequences of the VGAM1470 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM1470 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1470 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1470 are further described hereinbelow with reference to Table 1.

[20547] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1470 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20548] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 1471 (VGAM1471) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20549] VGAM1471 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1471 was detected is described hereinabove with reference to Figs. 2–8.

[20550] VGAM1471 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cocksfoot streak virus (CSV). VGAM1471 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20551] VGAM1471 gene, herein designated VGAM GENE, encodes a VGAM1471 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1471 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1471 precursor RNA is designated SEQ ID:1457, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1457 is located at position 4782

relative to the genome of Cocksfoot streak virus (CSV).

[20552] VGAM1471 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1471 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20553] An enzyme complex designated DICER COMPLEX, dices the VGAM1471 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1471 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1471 RNA is designated SEQ ID:4182, and is provided hereinbelow with reference to the sequence listing part.

[20554] VGAM1471 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1471 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1471 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20555] VGAM1471 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1471 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1471 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1471 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1471 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20556] The complementary binding of VGAM1471 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1471 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1471 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1471 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20557] It is appreciated that VGAM1471 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1471 host target genes. The mRNA of each one of this plurality of VGAM1471 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1471 RNA, herein designated VGAM RNA, and which when bound by VGAM1471 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1471 host target proteins.

[20558] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1471 gene, herein designated VGAM GENE, on one or more VGAM1471 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20559] It is yet further appreciated that a function of VGAM1471 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1471 include diagnosis, prevention and treatment of viral infection by Cocksfoot streak virus (CSV). Specific functions, and accordingly utilities, of VGAM1471 correlate with, and may be deduced from, the identity of the host target genes which VGAM1471 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20560] Nucleotide sequences of the VGAM1471 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1471 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1471 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1471 are further described hereinbelow with reference to Table 1.

[20561] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1471 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20562] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 1472 (VGAM1472) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20563] VGAM1472 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1472 was detected is described hereinabove with reference to Figs. 2–8.

[20564] VGAM1472 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cocksfoot streak virus (CSV). VGAM1472 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20565] VGAM1472 gene, herein designated VGAM GENE, encodes a VGAM1472 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1472 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1472 precursor RNA is designated SEQ ID:1458, and is provided hereinbelow with reference to the sequence listing part. Nu-

cleotide sequence SEQ ID:1458 is located at position 4423 relative to the genome of Cocksfoot streak virus (CSV).

[20566] VGAM1472 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM1472 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20567] An enzyme complex designated DICER COMPLEX, dices the VGAM1472 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1472 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1472 RNA is designated SEQ ID:4183, and is provided hereinbelow with reference to the sequence

listing part.

[20568] VGAM1472 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1472 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1472 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20569] VGAM1472 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1472 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1472 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM1472 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1472 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20570] The complementary binding of VGAM1472 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1472 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1472 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1472 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20571] It is appreciated that VGAM1472 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1472 host target genes. The mRNA of each one of this plurality of VGAM1472 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1472 RNA, herein designated VGAM RNA, and which when bound by VGAM1472 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1472 host target proteins.

[20572] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1472 gene, herein designated VGAM GENE, on one or more VGAM1472 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20573] It is yet further appreciated that a function of VGAM1472

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1472 include diagnosis, prevention and treatment of viral infection by Cocksfoot streak virus (CSV). Specific functions, and accordingly utilities, of VGAM1472 correlate with, and may be deduced from, the identity of the host target genes which VGAM1472 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20574] Nucleotide sequences of the VGAM1472 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1472 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1472 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1472 are further described hereinbelow with reference to Table 1.

[20575] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1472 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20576] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1473 (VGAM1473) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20577] VGAM1473 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1473 was detected is described hereinabove with reference to Figs. 2–8.

[20578] VGAM1473 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cocksfoot streak virus (CSV). VGAM1473 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20579] VGAM1473 gene, herein designated VGAM GENE, encodes a VGAM1473 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1473 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1473 precursor RNA is designated SEQ ID:1459, and is provided here–

inbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1459 is located at position 8361 relative to the genome of Cocksfoot streak virus (CSV).

[20580] VGAM1473 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1473 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20581] An enzyme complex designated DICER COMPLEX, dices the VGAM1473 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1473 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM1473 RNA is designated SEQ ID:4184, and

is provided hereinbelow with reference to the sequence listing part.

[20582] VGAM1473 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1473 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1473 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20583] VGAM1473 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1473 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1473 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1473 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1473 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20584] The complementary binding of VGAM1473 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1473 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1473 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1473 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20585] It is appreciated that VGAM1473 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1473 host target genes. The mRNA of each one of this plurality of VGAM1473 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1473 RNA, herein designated VGAM RNA, and which when bound by VGAM1473 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1473 host target proteins.

[20586] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1473 gene, herein designated VGAM GENE, on one or more VGAM1473 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20587] It is yet further appreciated that a function of VGAM1473 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1473 include diagnosis, prevention and treatment of viral infection by Cocksfoot streak virus (CSV). Specific functions, and accordingly utilities, of VGAM1473 correlate with, and may be deduced from, the identity of the host target genes which VGAM1473 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20588] Nucleotide sequences of the VGAM1473 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1473 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1473 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1473 are further described hereinbelow with reference to Table 1.

[20589] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1473 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20590] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1474 (VGAM1474) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20591] VGAM1474 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1474 was detected is described hereinabove with reference to Figs. 2–8.

[20592] VGAM1474 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cocksfoot streak virus (CSV). VGAM1474 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20593] VGAM1474 gene, herein designated VGAM GENE, encodes a VGAM1474 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1474 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1474 precu-

sor RNA is designated SEQ ID:1460, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1460 is located at position 761 relative to the genome of Cocksfoot streak virus (CSV).

[20594] VGAM1474 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1474 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20595] An enzyme complex designated DICER COMPLEX, dices the VGAM1474 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1474 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide se-

quence of VGAM1474 RNA is designated SEQ ID:4185, and is provided hereinbelow with reference to the sequence listing part.

[20596] VGAM1474 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1474 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1474 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20597] VGAM1474 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1474 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1474 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1474 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1474 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20598] The complementary binding of VGAM1474 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1474 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1474 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1474 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20599] It is appreciated that VGAM1474 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1474 host target genes. The mRNA of

each one of this plurality of VGAM1474 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1474 RNA, herein designated VGAM RNA, and which when bound by VGAM1474 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1474 host target proteins.

[20600] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1474 gene, herein designated VGAM GENE, on one or more VGAM1474 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[20601] It is yet further appreciated that a function of VGAM1474 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1474 include diagnosis, prevention and treatment of viral infection by Cocksfoot streak virus (CSV). Specific functions, and accordingly utilities, of VGAM1474 correlate with, and may be deduced from, the identity of the host target genes which VGAM1474 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20602] Nucleotide sequences of the VGAM1474 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1474 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1474 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1474 are further described hereinbelow with reference to Table 1.

[20603] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1474 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[20604] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1475 (VGAM1475) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20605] VGAM1475 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1475 was detected is described hereinabove with reference to Figs. 2–8.

[20606] VGAM1475 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cocksfoot streak virus (CSV). VGAM1475 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20607] VGAM1475 gene, herein designated VGAM GENE, encodes a VGAM1475 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1475 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM1475 precursor RNA is designated SEQ ID:1461, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1461 is located at position 3422 relative to the genome of Cocksfoot streak virus (CSV).

[20608] VGAM1475 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1475 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20609] An enzyme complex designated DICER COMPLEX, dices the VGAM1475 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1475 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1475 RNA is designated SEQ ID:4186, and is provided hereinbelow with reference to the sequence listing part.

[20610] VGAM1475 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1475 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1475 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20611] VGAM1475 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1475 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1475 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1475 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1475 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20612] The complementary binding of VGAM1475 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1475 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1475 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1475 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20613] It is appreciated that VGAM1475 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1475 host target genes. The mRNA of each one of this plurality of VGAM1475 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1475 RNA, herein designated VGAM RNA, and which when bound by VGAM1475 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1475 host target proteins.

[20614] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1475 gene, herein designated VGAM GENE, on one or more VGAM1475 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [20615] It is yet further appreciated that a function of VGAM1475 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1475 include diagnosis, prevention and treatment of viral infection by Cocksfoot streak virus (CSV). Specific functions, and accordingly utilities, of VGAM1475 correlate with, and may be deduced from, the identity of the host target genes which VGAM1475 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [20616] Nucleotide sequences of the VGAM1475 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1475 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1475 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1475 are further described hereinbelow with reference to Table 1.
- [20617] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM1475 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20618] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1476 (VGAM1476) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20619] VGAM1476 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1476 was detected is described hereinabove with reference to Figs. 2-8.

[20620] VGAM1476 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cocksfoot streak virus (CSV). VGAM1476 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20621] VGAM1476 gene, herein designated VGAM GENE, encodes a VGAM1476 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1476 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1476 precursor RNA is designated SEQ ID:1462, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1462 is located at position 7485 relative to the genome of Cocksfoot streak virus (CSV).

[20622] VGAM1476 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1476 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20623] An enzyme complex designated DICER COMPLEX, dices the VGAM1476 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1476 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1476 RNA is designated SEQ ID:4187, and is provided hereinbelow with reference to the sequence listing part.

[20624] VGAM1476 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1476 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1476 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20625] VGAM1476 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1476 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1476 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1476 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1476 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20626] The complementary binding of VGAM1476 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1476 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1476 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1476 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20627] It is appreciated that VGAM1476 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1476 host target genes. The mRNA of each one of this plurality of VGAM1476 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1476 RNA, herein designated VGAM RNA, and which when bound by VGAM1476 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1476 host target proteins.

[20628] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1476 gene, herein designated VGAM GENE, on one or more VGAM1476 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20629] It is yet further appreciated that a function of VGAM1476 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1476 include diagnosis, prevention and treatment of viral infection by Cocksfoot streak virus (CSV). Specific functions, and accordingly utilities, of VGAM1476 correlate with, and may be deduced from, the identity of the host target genes which VGAM1476 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20630] Nucleotide sequences of the VGAM1476 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1476 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1476 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1476 are further described hereinbelow with reference to Table 1.

[20631] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM1476 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20632] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1477 (VGAM1477) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20633] VGAM1477 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1477 was detected is described hereinabove with reference to Figs. 2–8.

[20634] VGAM1477 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cocksfoot streak virus (CSV). VGAM1477 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20635] VGAM1477 gene, herein designated VGAM GENE, encodes a VGAM1477 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1477 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1477 precursor RNA is designated SEQ ID:1463, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1463 is located at position 5489 relative to the genome of Cocksfoot streak virus (CSV).

[20636] VGAM1477 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1477 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20637] An enzyme complex designated DICER COMPLEX, dices the VGAM1477 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1477 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of VGAM1477 RNA is designated SEQ ID:4188, and is provided hereinbelow with reference to the sequence listing part.

[20638] VGAM1477 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1477 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1477 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20639] VGAM1477 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1477 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1477 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1477 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1477 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20640] The complementary binding of VGAM1477 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1477 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1477 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1477 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20641] It is appreciated that VGAM1477 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1477 host target genes. The mRNA of each one of this plurality of VGAM1477 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1477 RNA, herein designated VGAM RNA, and which when bound by VGAM1477 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1477 host target proteins.

[20642] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1477 gene, herein designated VGAM GENE, on one or more VGAM1477 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20643] It is yet further appreciated that a function of VGAM1477 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1477 include diagnosis, prevention and treatment of viral infection by Cocksfoot streak virus (CSV). Specific functions, and accordingly utilities, of VGAM1477 correlate with, and may be deduced from, the identity of the host target genes which VGAM1477 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20644] Nucleotide sequences of the VGAM1477 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1477 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1477 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1477 are further described hereinbelow with reference to Table 1.

[20645] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1477 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20646] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1478 (VGAM1478) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20647] VGAM1478 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1478 was detected is described hereinabove with reference to Figs. 2-8.

[20648] VGAM1478 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Brome streak mosaic virus. VGAM1478 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20649] VGAM1478 gene, herein designated VGAM GENE, encodes a VGAM1478 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM1478 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1478 precursor RNA is designated SEQ ID:1464, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1464 is located at position 7727 relative to the genome of Brome streak mosaic virus.

[20650] VGAM1478 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1478 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20651] An enzyme complex designated DICER COMPLEX, dices the VGAM1478 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1478 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM1478 RNA is designated SEQ ID:4189, and is provided hereinbelow with reference to the sequence listing part.

[20652] VGAM1478 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1478 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1478 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20653] VGAM1478 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1478 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1478 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1478 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1478 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20654] The complementary binding of VGAM1478 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1478 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1478 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1478 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[20655] It is appreciated that VGAM1478 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1478 host target genes. The mRNA of each one of this plurality of VGAM1478 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1478 RNA, herein designated VGAM RNA, and which when bound by VGAM1478 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1478 host target proteins.

[20656] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1478 gene, herein designated VGAM GENE, on one or more VGAM1478 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20657] It is yet further appreciated that a function of VGAM1478 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1478 include diagnosis, prevention and treatment of viral infection by Brome streak mosaic virus. Specific functions, and accordingly utilities, of VGAM1478 correlate with, and may be deduced from, the identity of the host target genes which VGAM1478 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20658] Nucleotide sequences of the VGAM1478 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1478 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1478 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1478 are further described hereinbelow with reference to Table 1.

[20659] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1478 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20660] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1479 (VGAM1479) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20661] VGAM1479 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1479 was detected is described hereinabove with reference to Figs. 2-8.

[20662] VGAM1479 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Brome streak mosaic virus. VGAM1479 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20663] VGAM1479 gene, herein designated VGAM GENE, encodes a VGAM1479 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1479 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1479 precursor RNA is designated SEQ ID:1465, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1465 is located at position 2629 relative to the genome of Brome streak mosaic virus.

[20664] VGAM1479 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1479 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20665] An enzyme complex designated DICER COMPLEX, dices the VGAM1479 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1479 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1479 RNA is designated SEQ ID:4190, and is provided hereinbelow with reference to the sequence listing part.

[20666] VGAM1479 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1479 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1479 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20667] VGAM1479 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1479 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1479 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1479 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1479 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20668] The complementary binding of VGAM1479 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1479 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1479 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1479 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20669] It is appreciated that VGAM1479 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1479 host target genes. The mRNA of each one of this plurality of VGAM1479 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1479 RNA, herein designated VGAM RNA, and which when bound by VGAM1479 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1479 host target proteins.

[20670] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1479 gene, herein designated VGAM GENE, on one or more VGAM1479 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20671] It is yet further appreciated that a function of VGAM1479 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1479 include diagnosis, prevention and treatment of viral infection by Brome streak mosaic virus. Specific functions, and accordingly utilities, of VGAM1479 correlate with, and may be deduced from, the identity of the host target genes which VGAM1479 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20672] Nucleotide sequences of the VGAM1479 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1479 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1479 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1479 are further described hereinbelow with reference to Table 1.

[20673] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1479 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20674] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1480 (VGAM1480) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20675] VGAM1480 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1480 was detected is described hereinabove with reference to Figs. 2-8.

[20676] VGAM1480 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Brome streak mosaic virus. VGAM1480 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20677] VGAM1480 gene, herein designated VGAM GENE, encodes

a VGAM1480 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1480 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1480 precursor RNA is designated SEQ ID:1466, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1466 is located at position 9535 relative to the genome of Brome streak mosaic virus.

[20678] VGAM1480 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1480 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20679] An enzyme complex designated DICER COMPLEX, dices the VGAM1480 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1480 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM1480 RNA is designated SEQ ID:4191, and is provided hereinbelow with reference to the sequence listing part.

[20680] VGAM1480 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1480 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1480 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20681] VGAM1480 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1480 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1480 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1480 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1480 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20682] The complementary binding of VGAM1480 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1480 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1480 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM1480 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20683] It is appreciated that VGAM1480 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1480 host target genes. The mRNA of each one of this plurality of VGAM1480 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1480 RNA, herein designated VGAM RNA, and which when bound by VGAM1480 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1480 host target proteins.

[20684] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1480 gene, herein designated VGAM GENE, on one or more VGAM1480 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20685] It is yet further appreciated that a function of VGAM1480 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1480 include diagnosis, prevention and treatment of viral infection by Brome streak mosaic virus. Specific functions, and accordingly utilities, of VGAM1480 correlate with, and may be deduced from, the identity of the host target genes which VGAM1480 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20686] Nucleotide sequences of the VGAM1480 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1480 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1480 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1480 are further

described hereinbelow with reference to Table 1.

[20687] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1480 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20688] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1481 (VGAM1481) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20689] VGAM1481 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1481 was detected is described hereinabove with reference to Figs. 2-8.

[20690] VGAM1481 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Brome streak mosaic virus. VGAM1481 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20691] VGAM1481 gene, herein designated VGAM GENE, encodes a VGAM1481 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1481 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1481 precursor RNA is designated SEQ ID:1467, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1467 is located at position 953 relative to the genome of Brome streak mosaic virus.

[20692] VGAM1481 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1481 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20693] An enzyme complex designated DICER COMPLEX, dices the VGAM1481 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM1481 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1481 RNA is designated SEQ ID:4192, and is provided hereinbelow with reference to the sequence listing part.

[20694] VGAM1481 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1481 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1481 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20695] VGAM1481 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1481 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1481 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1481 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1481 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20696] The complementary binding of VGAM1481 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1481 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1481

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1481 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20697] It is appreciated that VGAM1481 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1481 host target genes. The mRNA of each one of this plurality of VGAM1481 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1481 RNA, herein designated VGAM RNA, and which when bound by VGAM1481 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1481 host target proteins.

[20698] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1481 gene, herein designated VGAM GENE, on one or more VGAM1481 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20699] It is yet further appreciated that a function of VGAM1481 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1481 include diagnosis, prevention and treatment of viral infection by Brome streak mosaic virus. Specific functions, and accordingly utilities, of VGAM1481 correlate with, and may be deduced from, the identity of the host target genes which VGAM1481 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20700] Nucleotide sequences of the VGAM1481 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1481 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1481 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1481 are further described hereinbelow with reference to Table 1.

[20701] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1481 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20702] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1482 (VGAM1482) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20703] VGAM1482 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1482 was detected is described hereinabove with reference to Figs. 2-8.

[20704] VGAM1482 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Brome streak mosaic virus. VGAM1482 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[20705] VGAM1482 gene, herein designated VGAM GENE, encodes a VGAM1482 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1482 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1482 precursor RNA is designated SEQ ID:1468, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1468 is located at position 40 relative to the genome of Brome streak mosaic virus.

[20706] VGAM1482 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1482 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20707] An enzyme complex designated DICER COMPLEX, dices

the VGAM1482 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1482 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1482 RNA is designated SEQ ID:4193, and is provided hereinbelow with reference to the sequence listing part.

[20708] VGAM1482 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1482 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1482 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20709] VGAM1482 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1482 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1482 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1482 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1482 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20710] The complementary binding of VGAM1482 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1482 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1482 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1482 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20711] It is appreciated that VGAM1482 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1482 host target genes. The mRNA of each one of this plurality of VGAM1482 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1482 RNA, herein designated VGAM RNA, and which when bound by VGAM1482 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1482 host target proteins.

[20712] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1482 gene, herein designated VGAM GENE, on one or more VGAM1482 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20713] It is yet further appreciated that a function of VGAM1482 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1482 include diagnosis, prevention and treatment of viral infection by Brome streak mosaic virus. Specific functions, and accordingly utilities, of VGAM1482 correlate with, and may be deduced from, the identity of the host target genes which VGAM1482 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20714] Nucleotide sequences of the VGAM1482 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1482 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM1482 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1482 are further described hereinbelow with reference to Table 1.

[20715] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1482 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20716] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1483 (VGAM1483) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20717] VGAM1483 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1483 was detected is described hereinabove with reference to Figs. 2-8.

[20718] VGAM1483 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Brome streak mosaic virus. VGAM1483 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20719] VGAM1483 gene, herein designated VGAM GENE, encodes a VGAM1483 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1483 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1483 precursor RNA is designated SEQ ID:1469, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1469 is located at position 7435 relative to the genome of Brome streak mosaic virus.

[20720] VGAM1483 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1483 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20721] An enzyme complex designated DICER COMPLEX, dices the VGAM1483 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1483 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1483 RNA is designated SEQ ID:4194, and is provided hereinbelow with reference to the sequence listing part.

[20722] VGAM1483 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1483 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1483 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20723] VGAM1483 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1483 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1483 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1483 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1483 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20724] The complementary binding of VGAM1483 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1483 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1483 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1483 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20725] It is appreciated that VGAM1483 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1483 host target genes. The mRNA of each one of this plurality of VGAM1483 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1483 RNA, herein designated VGAM RNA, and which when bound by VGAM1483 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1483 host target proteins.

[20726] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1483 gene, herein designated VGAM GENE, on one or more VGAM1483 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20727] It is yet further appreciated that a function of VGAM1483 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1483 include diagnosis, prevention and treatment of viral infection by Brome streak mosaic virus. Specific functions, and accordingly utilities, of VGAM1483 correlate with, and may be deduced from, the identity of the host target genes which VGAM1483 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20728] Nucleotide sequences of the VGAM1483 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1483 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM1483 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1483 are further described hereinbelow with reference to Table 1.

[20729] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1483 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20730] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1484 (VGAM1484) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20731] VGAM1484 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1484 was detected is described hereinabove with reference to Figs. 2-8.

[20732] VGAM1484 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2.

VGAM1484 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20733] VGAM1484 gene, herein designated VGAM GENE, encodes a VGAM1484 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1484 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1484 precursor RNA is designated SEQ ID:1470, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1470 is located at position 80382 relative to the genome of Gallid herpesvirus 2.

[20734] VGAM1484 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1484 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[20735] An enzyme complex designated DICER COMPLEX, dices the VGAM1484 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1484 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1484 RNA is designated SEQ ID:4195, and is provided hereinbelow with reference to the sequence listing part.

[20736] VGAM1484 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1484 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1484 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20737] VGAM1484 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1484 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1484 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1484 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1484 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20738] The complementary binding of VGAM1484 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1484 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1484 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1484 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20739] It is appreciated that VGAM1484 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1484 host target genes. The mRNA of each one of this plurality of VGAM1484 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1484 RNA, herein designated VGAM RNA, and which when bound by VGAM1484 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1484 host target proteins.

[20740] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1484 gene, herein designated VGAM GENE, on one or more VGAM1484 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20741] It is yet further appreciated that a function of VGAM1484 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1484 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1484 correlate with, and may be deduced from, the identity of the host target genes which VGAM1484 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20742] Nucleotide sequences of the VGAM1484 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM1484 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1484 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1484 are further described hereinbelow with reference to Table 1.

[20743] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1484 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20744] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1485 (VGAM1485) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20745] VGAM1485 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1485 was detected is described hereinabove with reference to Figs. 2-8.

[20746] VGAM1485 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Gallid herpesvirus 2. VGAM1485 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20747] VGAM1485 gene, herein designated VGAM GENE, encodes a VGAM1485 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1485 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1485 precursor RNA is designated SEQ ID:1471, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1471 is located at position 81710 relative to the genome of Gallid herpesvirus 2.

[20748] VGAM1485 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1485 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20749] An enzyme complex designated DICER COMPLEX, dices the VGAM1485 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1485 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1485 RNA is designated SEQ ID:4196, and is provided hereinbelow with reference to the sequence listing part.

[20750] VGAM1485 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1485 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1485 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20751] VGAM1485 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1485 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1485 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1485 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1485 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20752] The complementary binding of VGAM1485 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1485 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1485 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1485 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20753] It is appreciated that VGAM1485 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1485 host target genes. The mRNA of each one of this plurality of VGAM1485 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1485 RNA, herein designated VGAM RNA, and which when bound by VGAM1485 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1485 host target proteins.

[20754] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1485 gene, herein designated VGAM GENE, on one or more VGAM1485 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20755] It is yet further appreciated that a function of VGAM1485 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1485 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1485 correlate with, and may be deduced from, the identity of the host target genes which VGAM1485 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20756] Nucleotide sequences of the VGAM1485 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM1485 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1485 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1485 are further described hereinbelow with reference to Table 1.

[20757] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1485 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20758] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1486 (VGAM1486) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20759] VGAM1486 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1486 was detected is described hereinabove with reference to Figs. 2-8.

[20760] VGAM1486 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2. VGAM1486 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20761] VGAM1486 gene, herein designated VGAM GENE, encodes a VGAM1486 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1486 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1486 precursor RNA is designated SEQ ID:1472, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1472 is located at position 82050 relative to the genome of Gallid herpesvirus 2.

[20762] VGAM1486 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1486 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20763] An enzyme complex designated DICER COMPLEX, dices the VGAM1486 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1486 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM1486 RNA is designated SEQ ID:4197, and is provided hereinbelow with reference to the sequence listing part.

[20764] VGAM1486 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1486 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1486 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[20765] VGAM1486 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1486 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1486 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1486 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1486 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20766] The complementary binding of VGAM1486 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1486 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1486 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1486 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20767] It is appreciated that VGAM1486 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1486 host target genes. The mRNA of each one of this plurality of VGAM1486 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1486 RNA, herein designated VGAM RNA, and which when bound by VGAM1486 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1486 host target proteins.

[20768] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1486 gene, herein designated VGAM GENE, on one

or more VGAM1486 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20769] It is yet further appreciated that a function of VGAM1486 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1486 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1486 correlate with, and may be deduced from, the identity of the host target genes which VGAM1486 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20770] Nucleotide sequences of the VGAM1486 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1486 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1486 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1486 are further described hereinbelow with reference to Table 1.

[20771] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1486 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20772] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1487 (VGAM1487) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20773] VGAM1487 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1487 was detected is de-

scribed hereinabove with reference to Figs. 2–8.

[20774] VGAM1487 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2.

VGAM1487 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20775] VGAM1487 gene, herein designated VGAM GENE, encodes a VGAM1487 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1487 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1487 precursor RNA is designated SEQ ID:1473, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1473 is located at position 80281 relative to the genome of Gallid herpesvirus 2.

[20776] VGAM1487 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1487 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20777] An enzyme complex designated DICER COMPLEX, dices the VGAM1487 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1487 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1487 RNA is designated SEQ ID:4198, and is provided hereinbelow with reference to the sequence listing part.

[20778] VGAM1487 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1487 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1487 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20779] VGAM1487 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1487 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1487 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1487 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1487 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[20780] The complementary binding of VGAM1487 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1487 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1487 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1487 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20781] It is appreciated that VGAM1487 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1487 host target genes. The mRNA of each one of this plurality of VGAM1487 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1487 RNA, herein designated VGAM RNA, and which when bound by VGAM1487 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1487 host target proteins.

[20782] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1487 gene, herein designated VGAM GENE, on one or more VGAM1487 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20783] It is yet further appreciated that a function of VGAM1487 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1487 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1487 correlate with, and may be deduced from, the identity of the host target genes which VGAM1487 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[20784] Nucleotide sequences of the VGAM1487 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1487 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1487 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1487 are further described hereinbelow with reference to Table 1.

[20785] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1487 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20786] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1488 (VGAM1488) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20787] VGAM1488 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1488 was detected is described hereinabove with reference to Figs. 2–8.

[20788] VGAM1488 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plum pox virus.

VGAM1488 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20789] VGAM1488 gene, herein designated VGAM GENE, encodes a VGAM1488 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1488 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1488 precursor RNA is designated SEQ ID:1474, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1474 is located at position 7567 relative to the genome of Plum pox virus.

[20790] VGAM1488 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1488 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20791] An enzyme complex designated DICER COMPLEX, dices the VGAM1488 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1488 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1488 RNA is designated SEQ ID:4199, and is provided hereinbelow with reference to the sequence listing part.

[20792] VGAM1488 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1488 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1488 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20793] VGAM1488 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1488 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1488 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1488 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1488 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20794] The complementary binding of VGAM1488 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1488 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1488 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1488 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20795] It is appreciated that VGAM1488 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1488 host target genes. The mRNA of each one of this plurality of VGAM1488 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1488 RNA, herein designated VGAM RNA, and which when bound by VGAM1488 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1488 host target proteins.

[20796] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1488 gene, herein designated VGAM GENE, on one or more VGAM1488 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20797] It is yet further appreciated that a function of VGAM1488 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1488 include diagnosis, prevention and treatment of viral infection by Plum pox virus. Specific functions, and accordingly utilities, of VGAM1488 correlate with, and may be deduced from, the identity of the host target genes which VGAM1488 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[20798] Nucleotide sequences of the VGAM1488 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1488 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1488 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1488 are further described hereinbelow with reference to Table 1.

[20799] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1488 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20800] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1489 (VGAM1489) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20801] VGAM1489 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1489 was detected is described hereinabove with reference to Figs. 2–8.

[20802] VGAM1489 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plum pox virus.

VGAM1489 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20803] VGAM1489 gene, herein designated VGAM GENE, encodes a VGAM1489 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1489 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1489 precursor RNA is designated SEQ ID:1475, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1475 is located at position 8790 relative to the genome of Plum pox virus.

[20804] VGAM1489 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1489 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20805] An enzyme complex designated DICER COMPLEX, dices the VGAM1489 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1489 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM1489 RNA is designated SEQ ID:4200, and is provided hereinbelow with reference to the sequence listing part.

[20806] VGAM1489 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1489 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1489 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20807] VGAM1489 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1489 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1489 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1489 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1489 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20808] The complementary binding of VGAM1489 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1489 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1489 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1489 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20809] It is appreciated that VGAM1489 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1489 host target genes. The mRNA of each one of this plurality of VGAM1489 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1489 RNA, herein designated VGAM RNA, and which when bound by VGAM1489 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1489 host target proteins.

[20810] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1489 gene, herein designated VGAM GENE, on one or more VGAM1489 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20811] It is yet further appreciated that a function of VGAM1489 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1489 include diagnosis, prevention and treatment of viral infection by Plum pox virus. Specific functions, and accordingly utilities, of VGAM1489 correlate with, and may be deduced from, the identity of the

host target genes which VGAM1489 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20812] Nucleotide sequences of the VGAM1489 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1489 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1489 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1489 are further described hereinbelow with reference to Table 1.

[20813] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1489 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20814] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1490 (VGAM1490) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20815] VGAM1490 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1490 was detected is described hereinabove with reference to Figs. 2–8.

[20816] VGAM1490 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plum pox virus. VGAM1490 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20817] VGAM1490 gene, herein designated VGAM GENE, encodes a VGAM1490 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1490 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1490 precursor RNA is designated SEQ ID:1476, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1476 is located at position 5866 relative to the genome of Plum pox virus.

[20818] VGAM1490 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1490 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20819] An enzyme complex designated DICER COMPLEX, dices the VGAM1490 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1490 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1490 RNA is designated SEQ ID:4201, and is provided hereinbelow with reference to the sequence listing part.

[20820] VGAM1490 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1490 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1490 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20821] VGAM1490 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1490 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1490 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1490 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1490 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20822] The complementary binding of VGAM1490 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1490 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1490 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1490 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20823] It is appreciated that VGAM1490 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1490 host target genes. The mRNA of each one of this plurality of VGAM1490 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1490 RNA, herein designated VGAM RNA, and which when bound by VGAM1490 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM1490 host target proteins.

[20824] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1490 gene, herein designated VGAM GENE, on one or more VGAM1490 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20825] It is yet further appreciated that a function of VGAM1490 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1490 include diagnosis, prevention and treatment of viral infection by Plum pox virus. Specific functions, and accordingly utilities, of VGAM1490 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM1490 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20826] Nucleotide sequences of the VGAM1490 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM1490 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1490 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1490 are further described hereinbelow with reference to Table 1.

[20827] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM1490 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20828] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1491 (VGAM1491) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[20829] VGAM1491 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1491 was detected is described hereinabove with reference to Figs. 2–8.

[20830] VGAM1491 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plum pox virus. VGAM1491 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20831] VGAM1491 gene, herein designated VGAM GENE, encodes a VGAM1491 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1491 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1491 precursor RNA is designated SEQ ID:1477, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1477 is located at position 5456 relative to the genome of Plum pox virus.

[20832] VGAM1491 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM1491 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20833] An enzyme complex designated DICER COMPLEX, dices the VGAM1491 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM1491 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1491 RNA is designated SEQ ID:4202, and is provided hereinbelow with reference to the sequence listing part.

[20834] VGAM1491 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1491 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1491 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[20835] VGAM1491 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1491 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1491 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM1491 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1491 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[20836] The complementary binding of VGAM1491 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1491 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1491 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM1491 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20837] It is appreciated that VGAM1491 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1491 host target genes. The mRNA of each one of this plurality of VGAM1491 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1491 RNA, herein designated VGAM RNA, and which when bound by VGAM1491 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM1491 host target proteins.

[20838] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1491 gene, herein designated VGAM GENE, on one or more VGAM1491 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[20839] It is yet further appreciated that a function of VGAM1491 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1491 include diagnosis, prevention and treatment of viral infection by Plum pox virus. Specific
